## COMPUTATION OF PHASE-DEPENDENT REFLECTED LIGHT SPECTROSCOPY WITH...

- ▶ Written in python but has retained the speed of the fortran
- ▶ Original Marley methodology with several updates
- ▶ Docs: <https://natashabatalha.GitHub.io/picaso>
- ▶ Math: [https://natashabatalha.Github.io/picaso\\_dev](https://natashabatalha.Github.io/picaso_dev)
- ▶ Front end in development

## 5-ish LINES TO A SPECTRUM

```
#phase angle
start_case.phase_angle(0) #radians

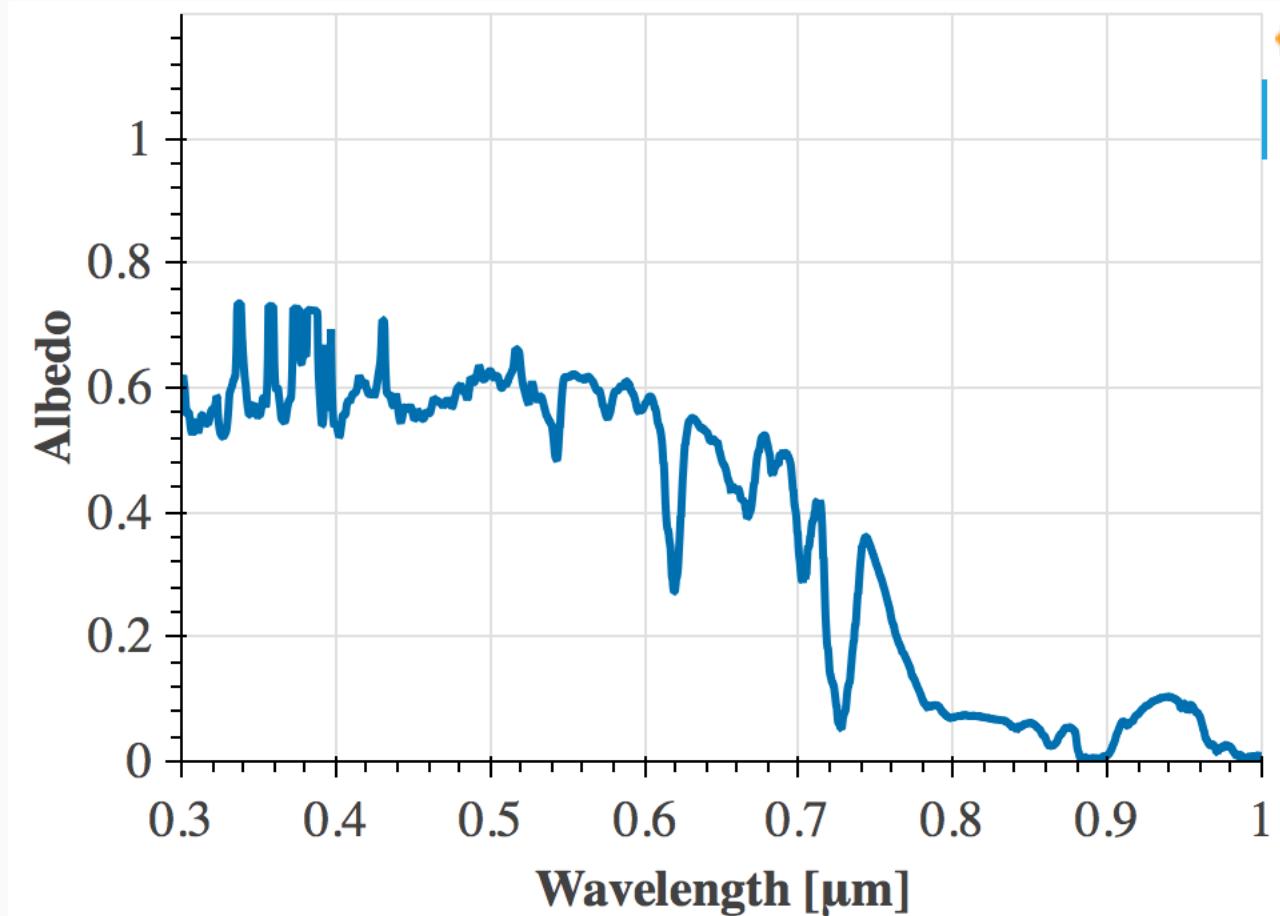

#define gravity
start_case.gravity(gravity=25, gravity_unit=u.Unit('m/(s**2)')) #any astropy units available

#define star
start_case.star(5000,0.4,0) #pysynphot database, temp, metallicity, logg

start_case.atmosphere(df = pd.DataFrame({'pressure':np.logspace(-6,2,60),
                                         'temperature':np.logspace(-6,2,60)*0+2
                                         00,
                                         "H2":np.logspace(-6,2,60)*0+0.837,
                                         "He":np.logspace(-6,2,60)*0+0.163,
                                         "CH4":np.logspace(-6,2,60)*0+0.000466}
                                         )
                                         )

wno_ch4, alb_ch4 = start_case.spectrum()

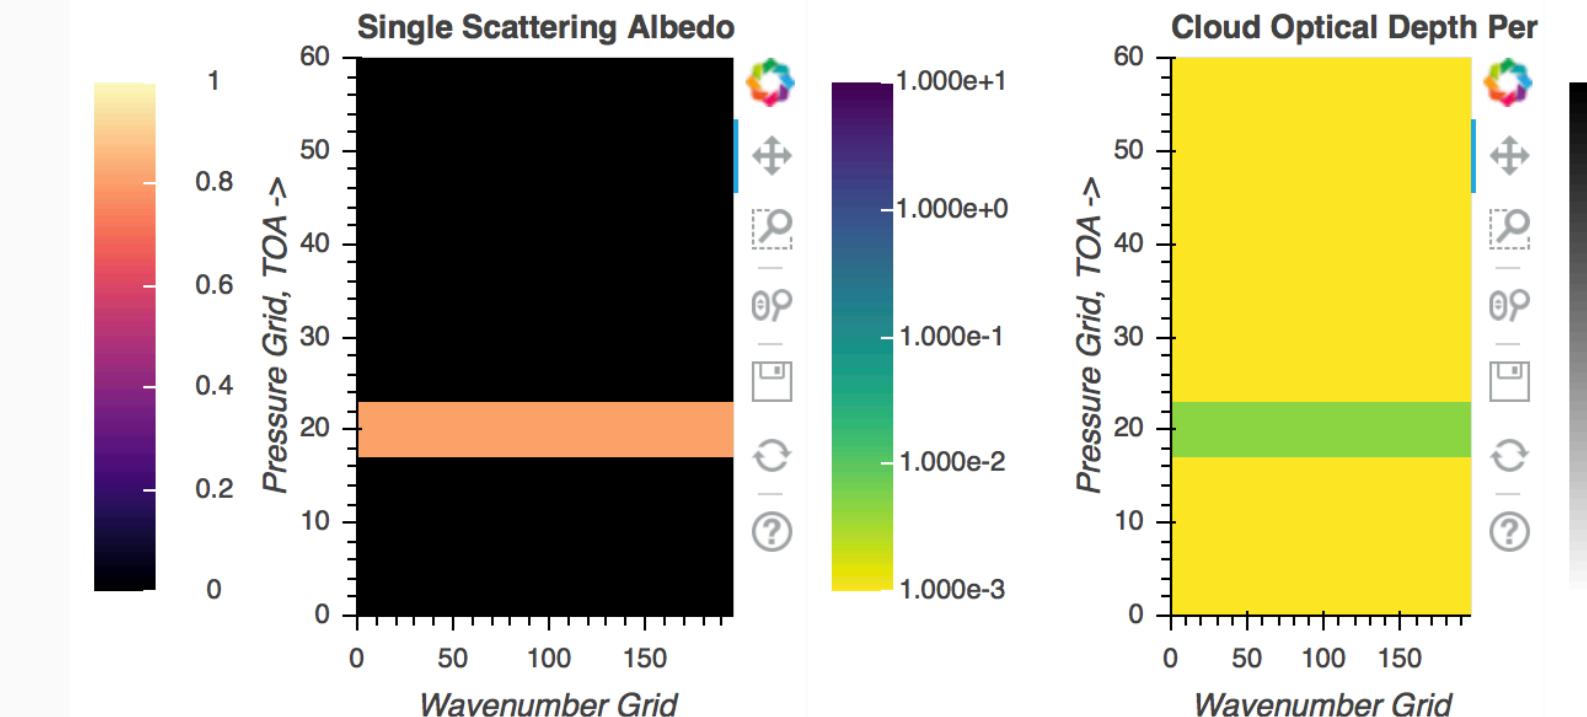

show(jpi.spectrum(wno_ch4, alb_ch4, plot_width=500))
```

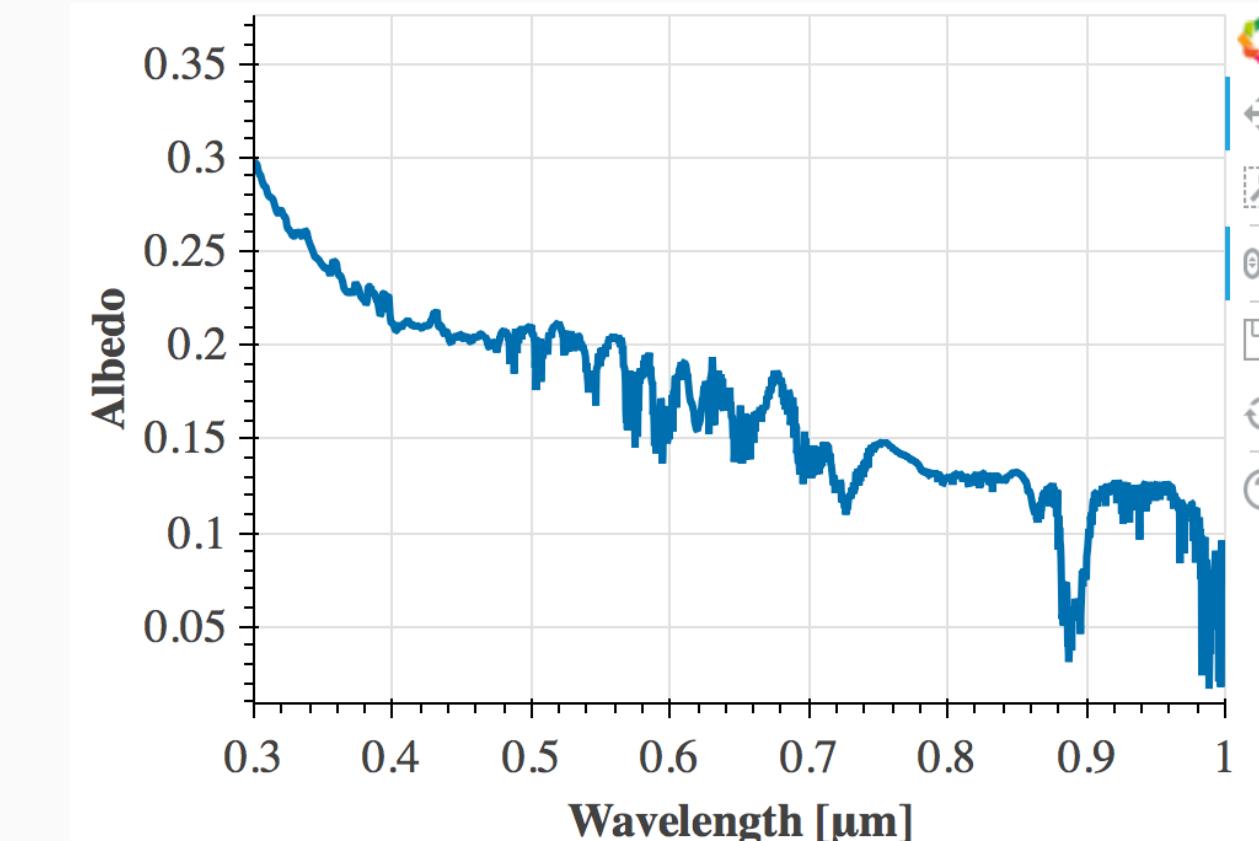

```
In [10]: #set model clouds, note these are lists since you can specify multiple cloud layers
case1.clouds(g0=[0.9], w0=[0.8], opd=[0.5], p=[1], dp=[5])
```

### Plotting simple cloud profile

```
In [11]: nwno = 196 #this is the default number for A&M cloud code (see below if your wave grid is different)
nlayer = 60 #one less than the number of PT points in your input
show(jpi.plot_cld_input(nwno, nlayer, df=case1.inputs['clouds']['profile']))
```

```
In [12]: wno, alb = case1.spectrum()
show(jpi.spectrum(wno, alb, plot_width=500))
```

Handles everything from "**simple**" or **parameterized** inputs to full **modeled** atmospheric profiles that can be read in as dictionaries, arrays, files, etc.

Ditto for clouds. "Simple" to fully modeled.

# The Radiative Transfer in PICASO

An explanation of the code.

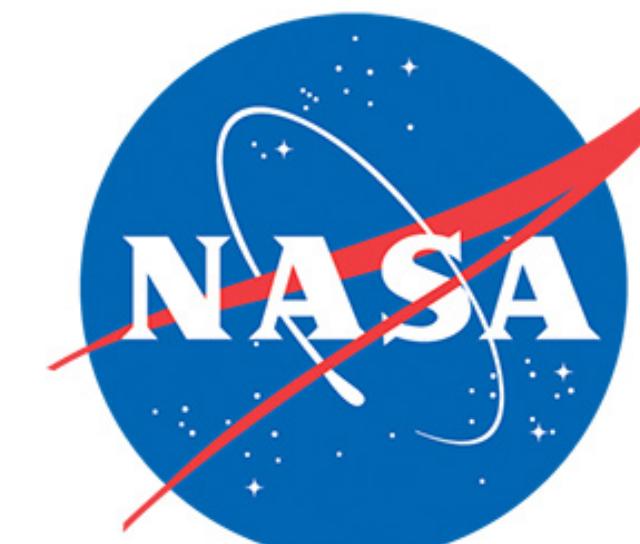

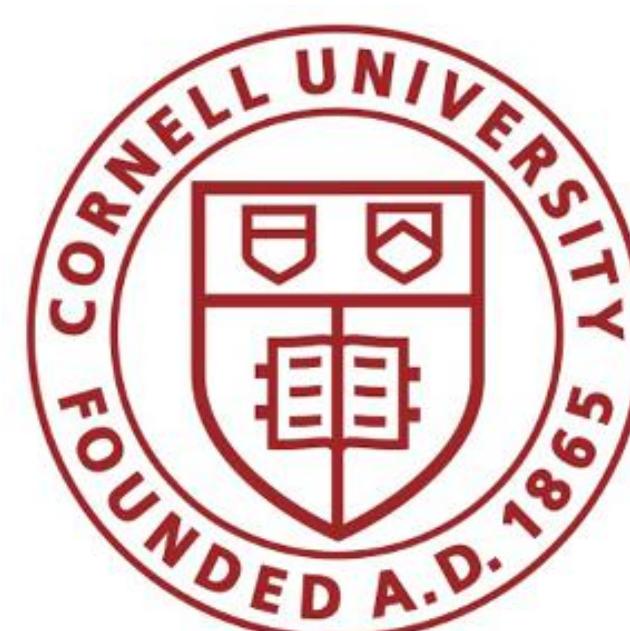

Scroll Down

Truly user-friendly atmosphere codes **must solve** inaccessible opacity problem.

*Downloadable tar file? But what about updates? I don't want 100s Gigs of opacities! What about availability of disk space?*

"A COMMUNITY TOOL FOR COMPUTING, VISUALIZING, AND MANIPULATING MOLECULAR & ATOMIC OPACITIES"

"A COMMUNITY TOOL FOR COMPUTING, VISUALIZING, AND MANIPULATING MOLECULAR & ATOMIC OPACITIES"

---

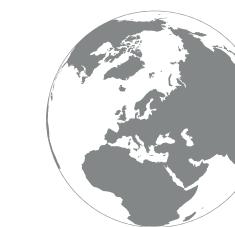

**ExoMol**

***Richard Freedman***

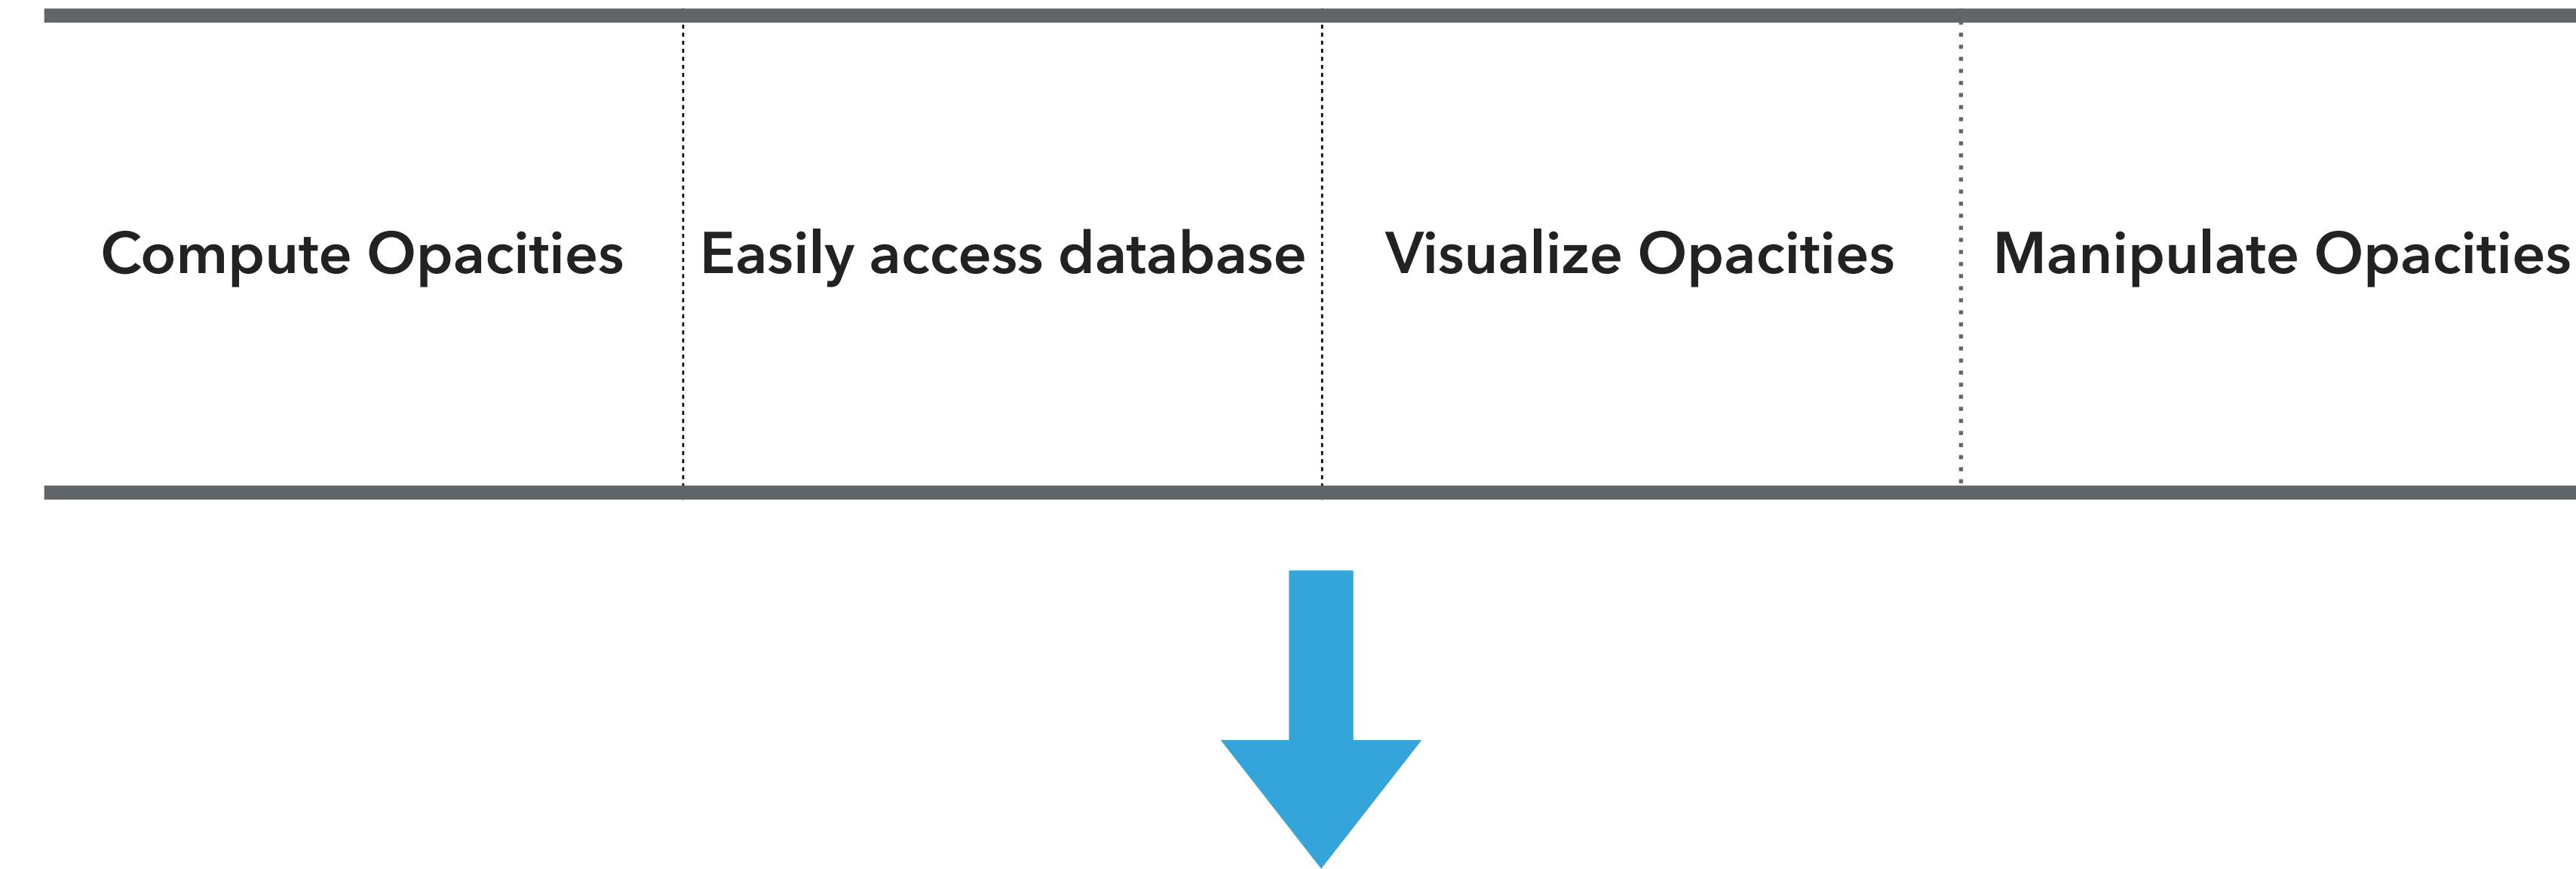

**HAPI**

***ExoCross***

## STEPPING STONE TO INCREASING ACCESSIBILITY OF OPACITIES

Novice

"Where does water absorb?"

Theorist

"I need opacities for my model"

Retrievals

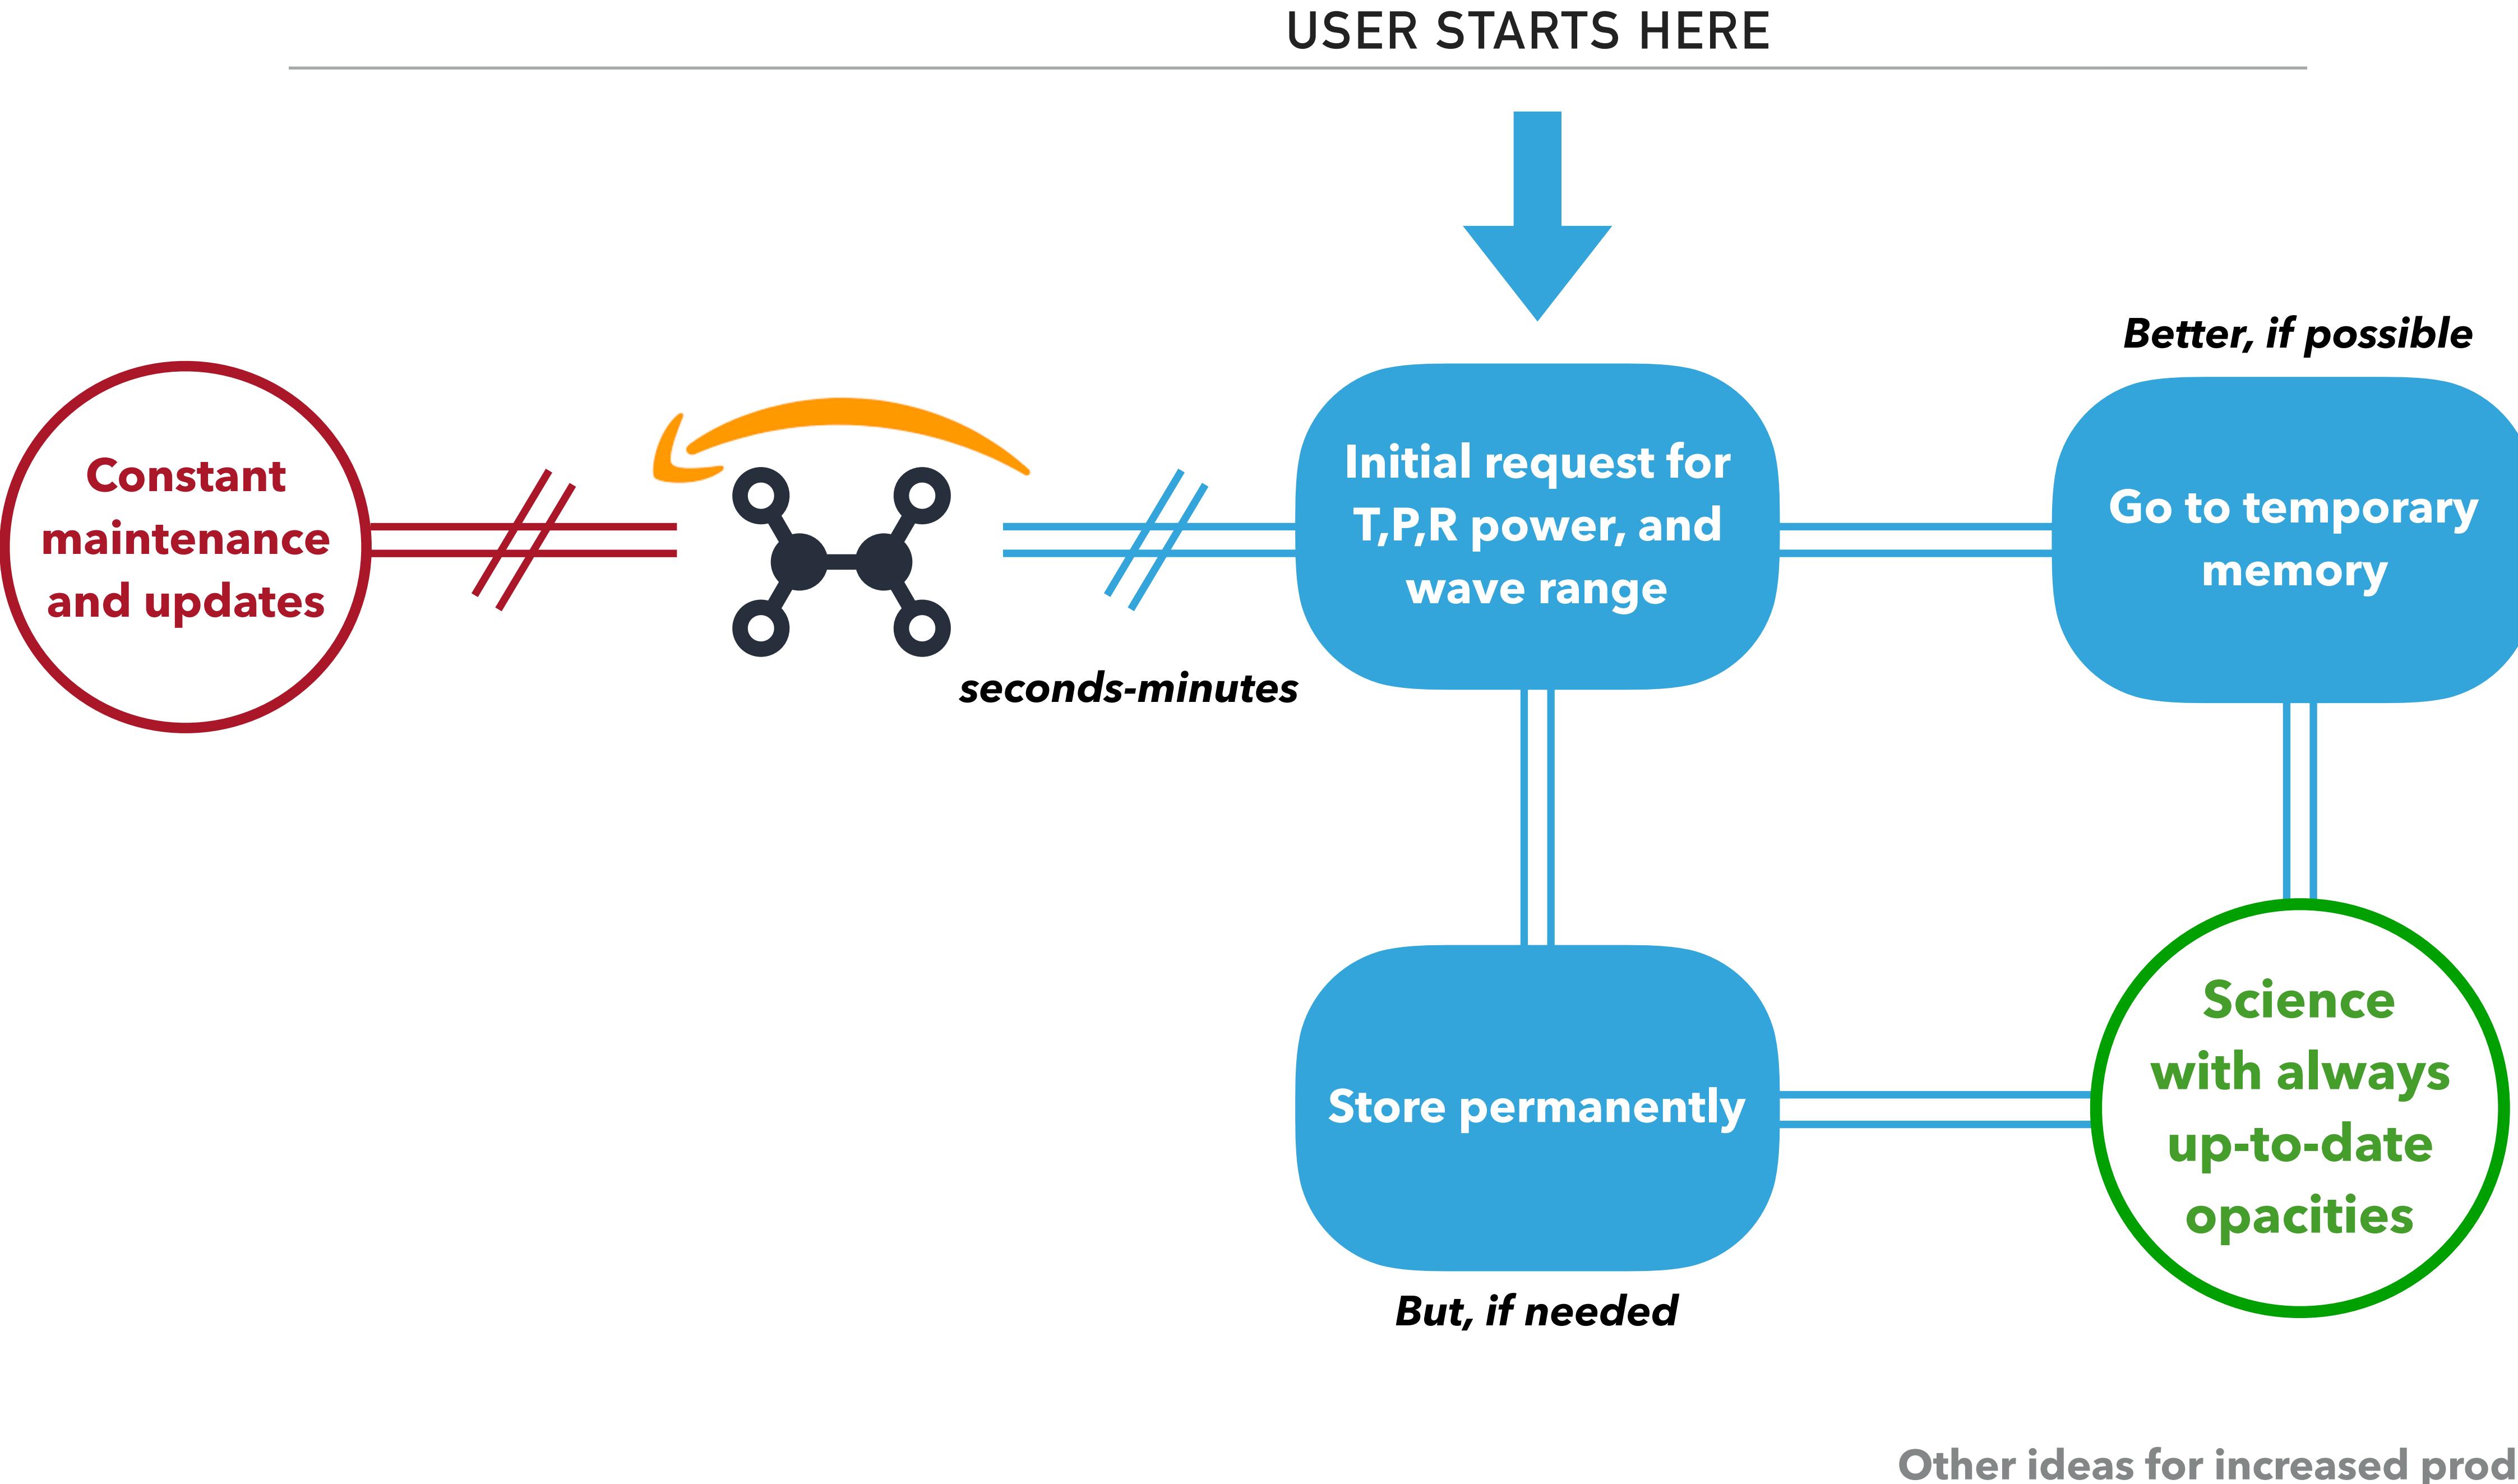

"Do changes in opacity sources change retrieved abundances?"

Observer

"What JWST mode do I use for detecting C<sub>2</sub>H<sub>2</sub>?"

Expert in Opacities

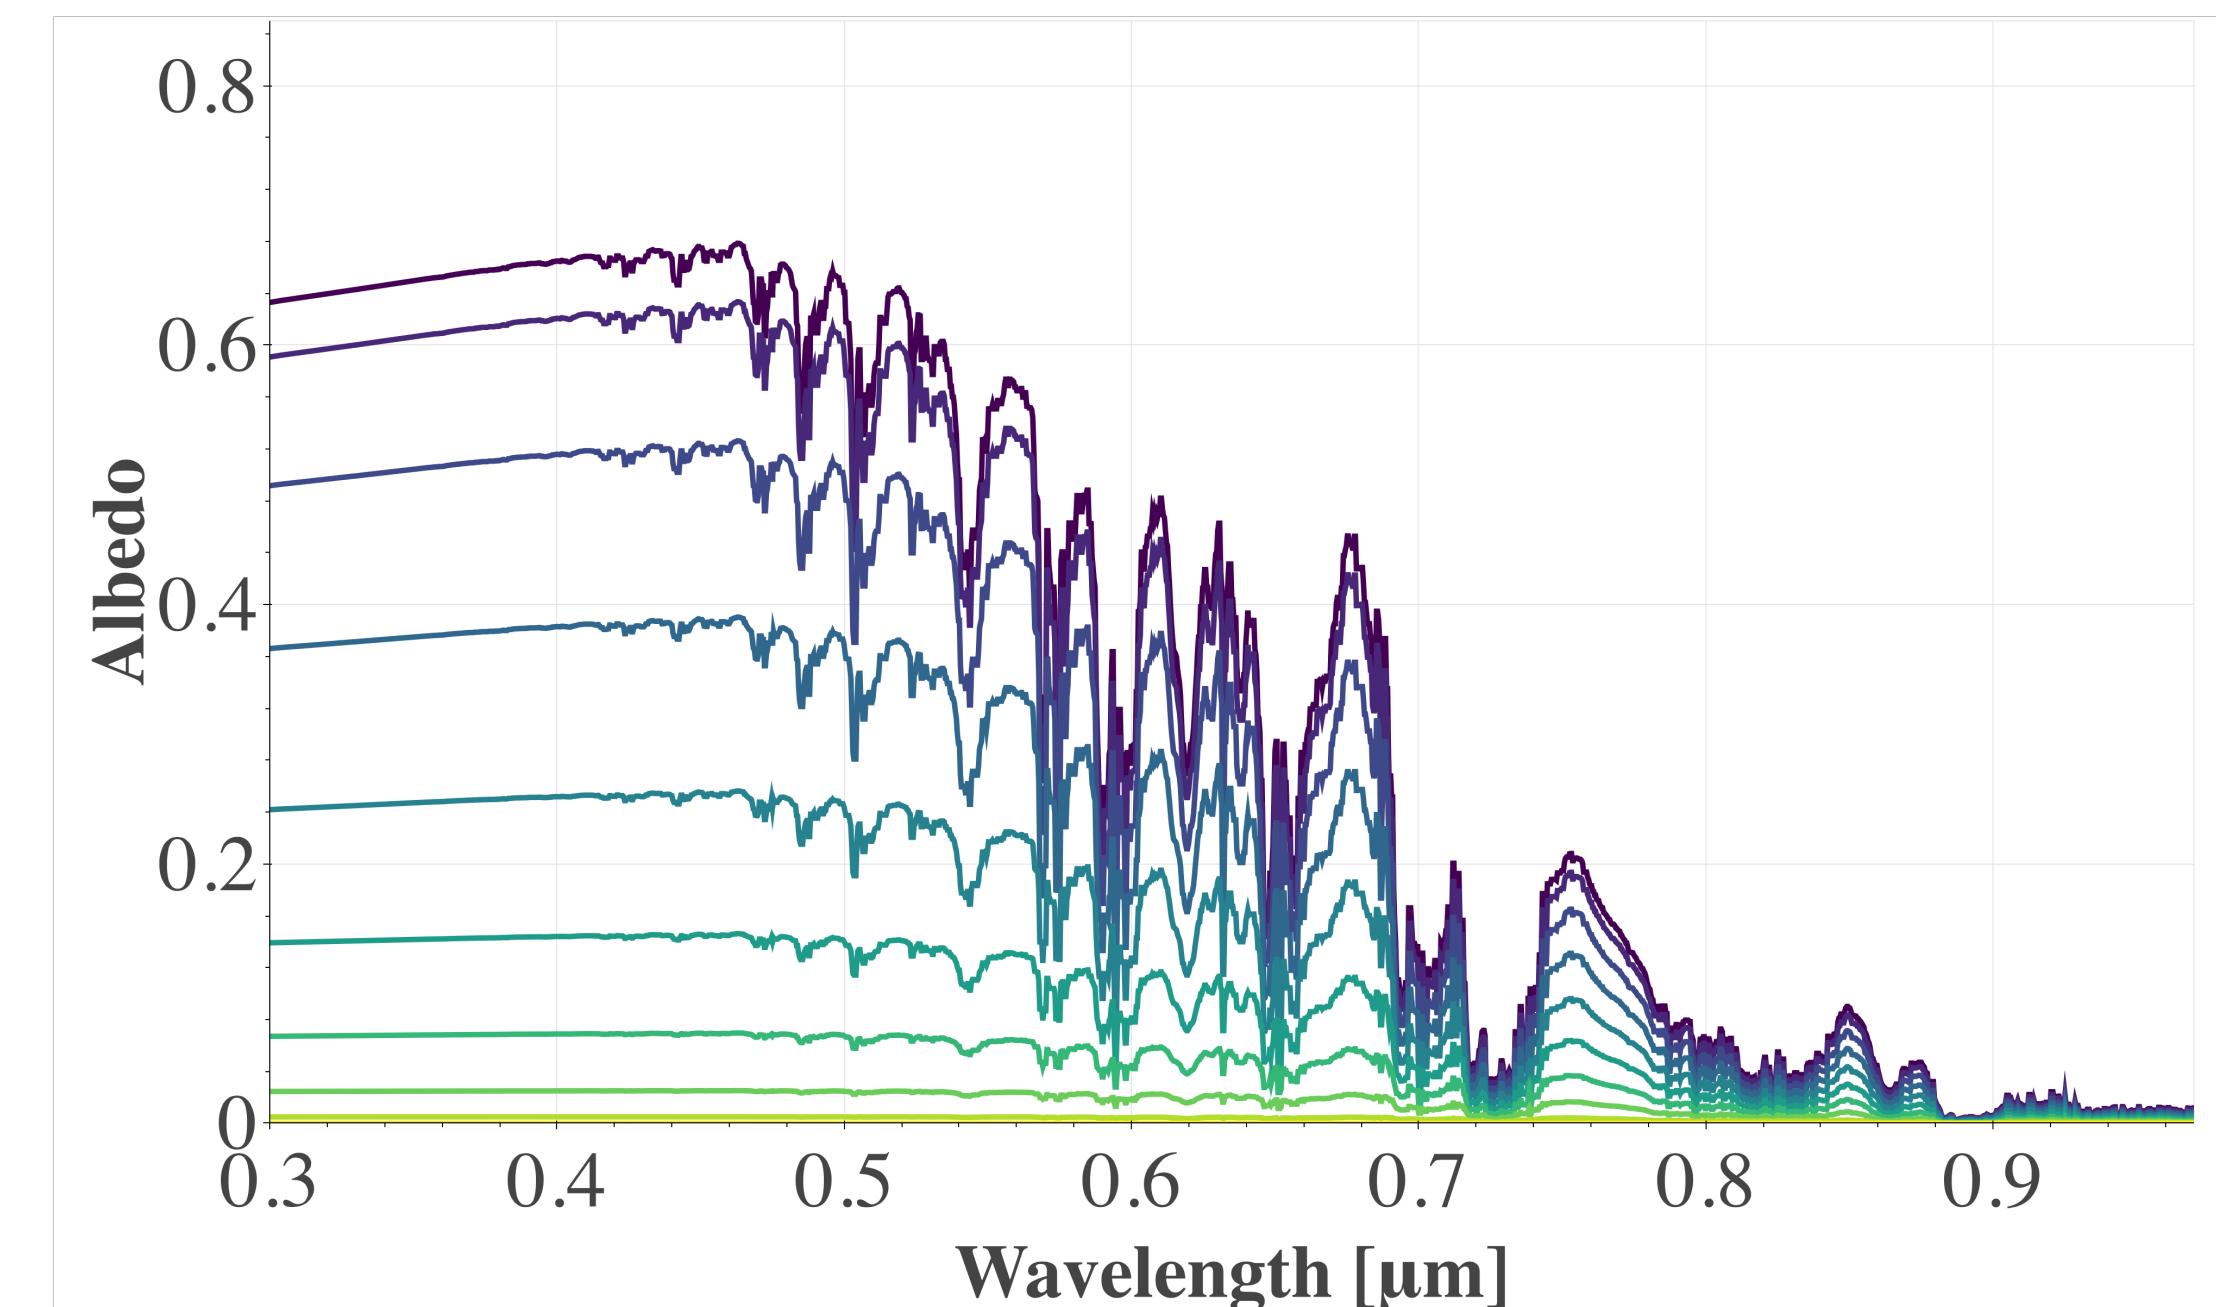

"I want to create my own line profile and contribute a pipeline module"

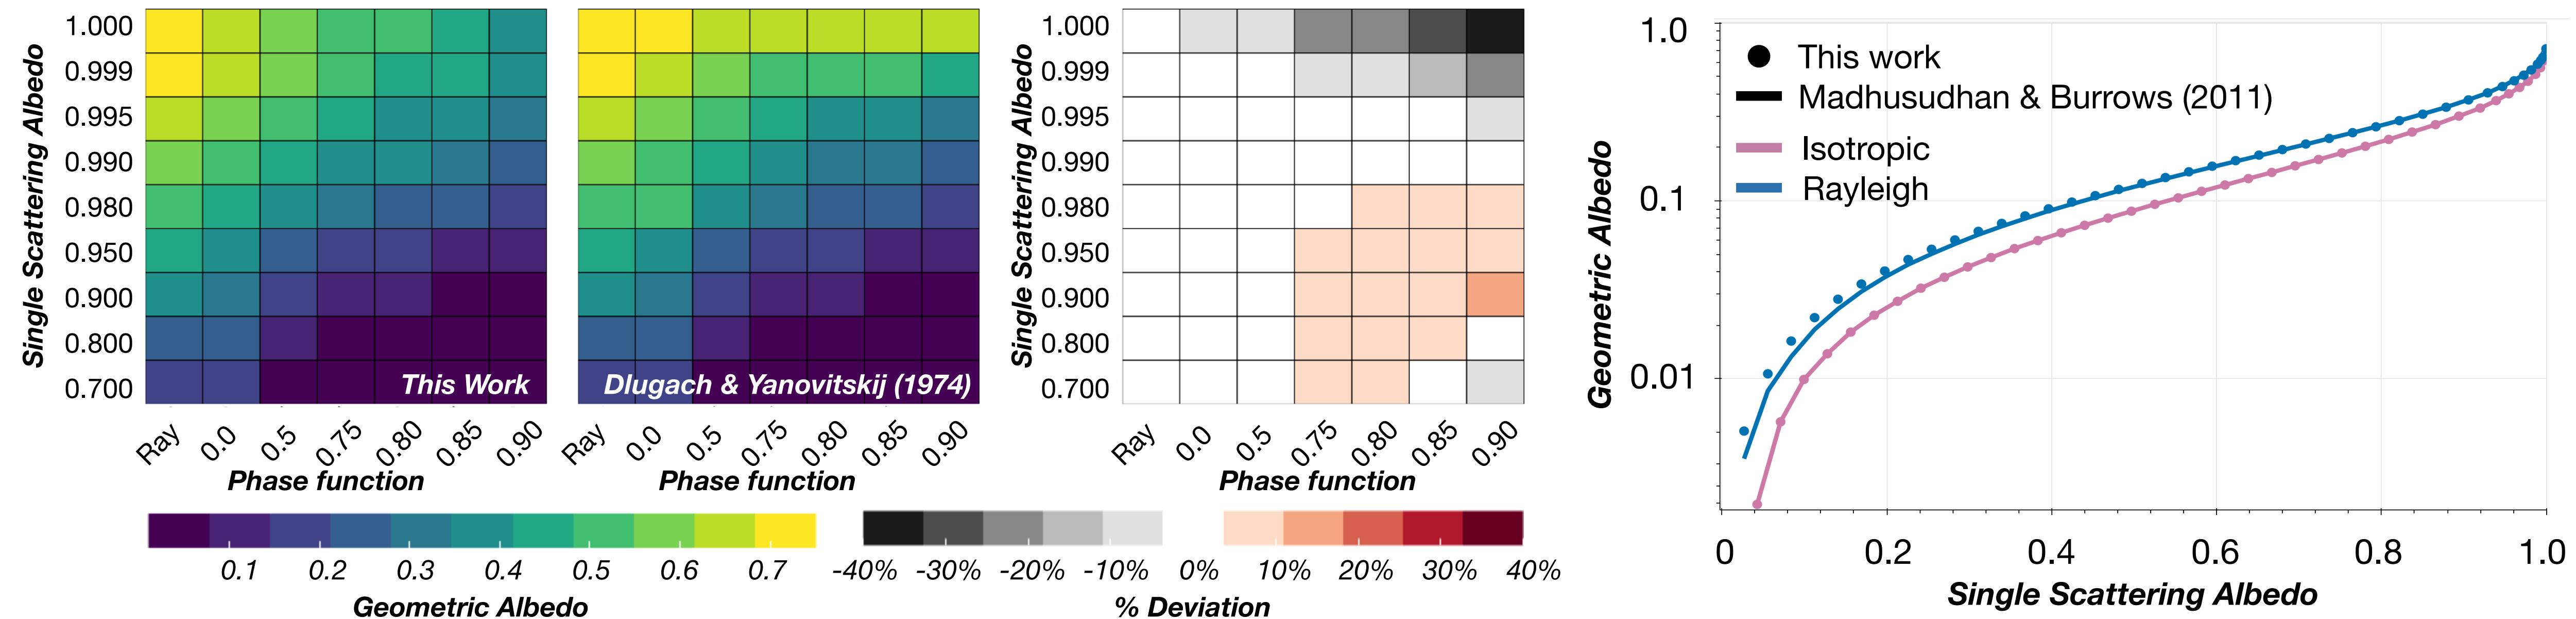

## COMPUTATION OF PHASE-DEPENDENT REFLECTED LIGHT SPECTROSCOPY WITH...

- ▶ **Highly accessible ! Yay!**
- ▶ But we also want something that is robust, reliable.

# TEST MODULES TO PROPERLY BASELINE WITH OLDER AND NEWER CODES

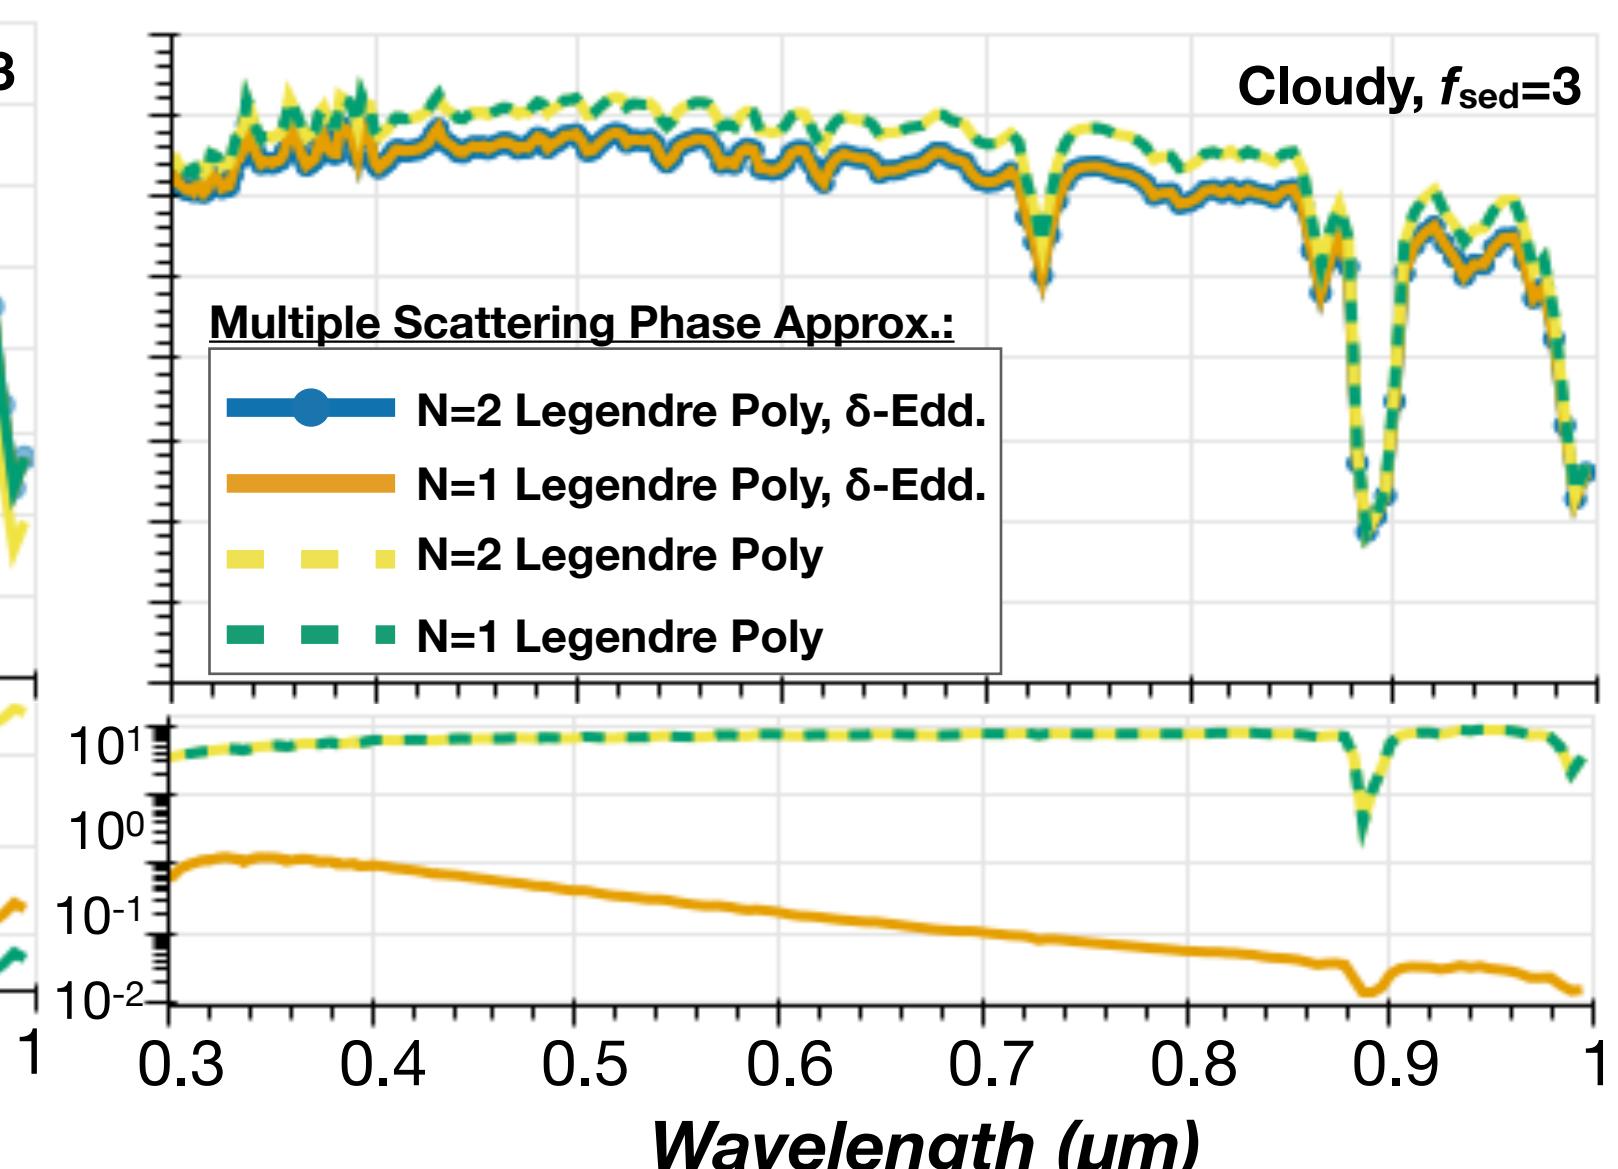

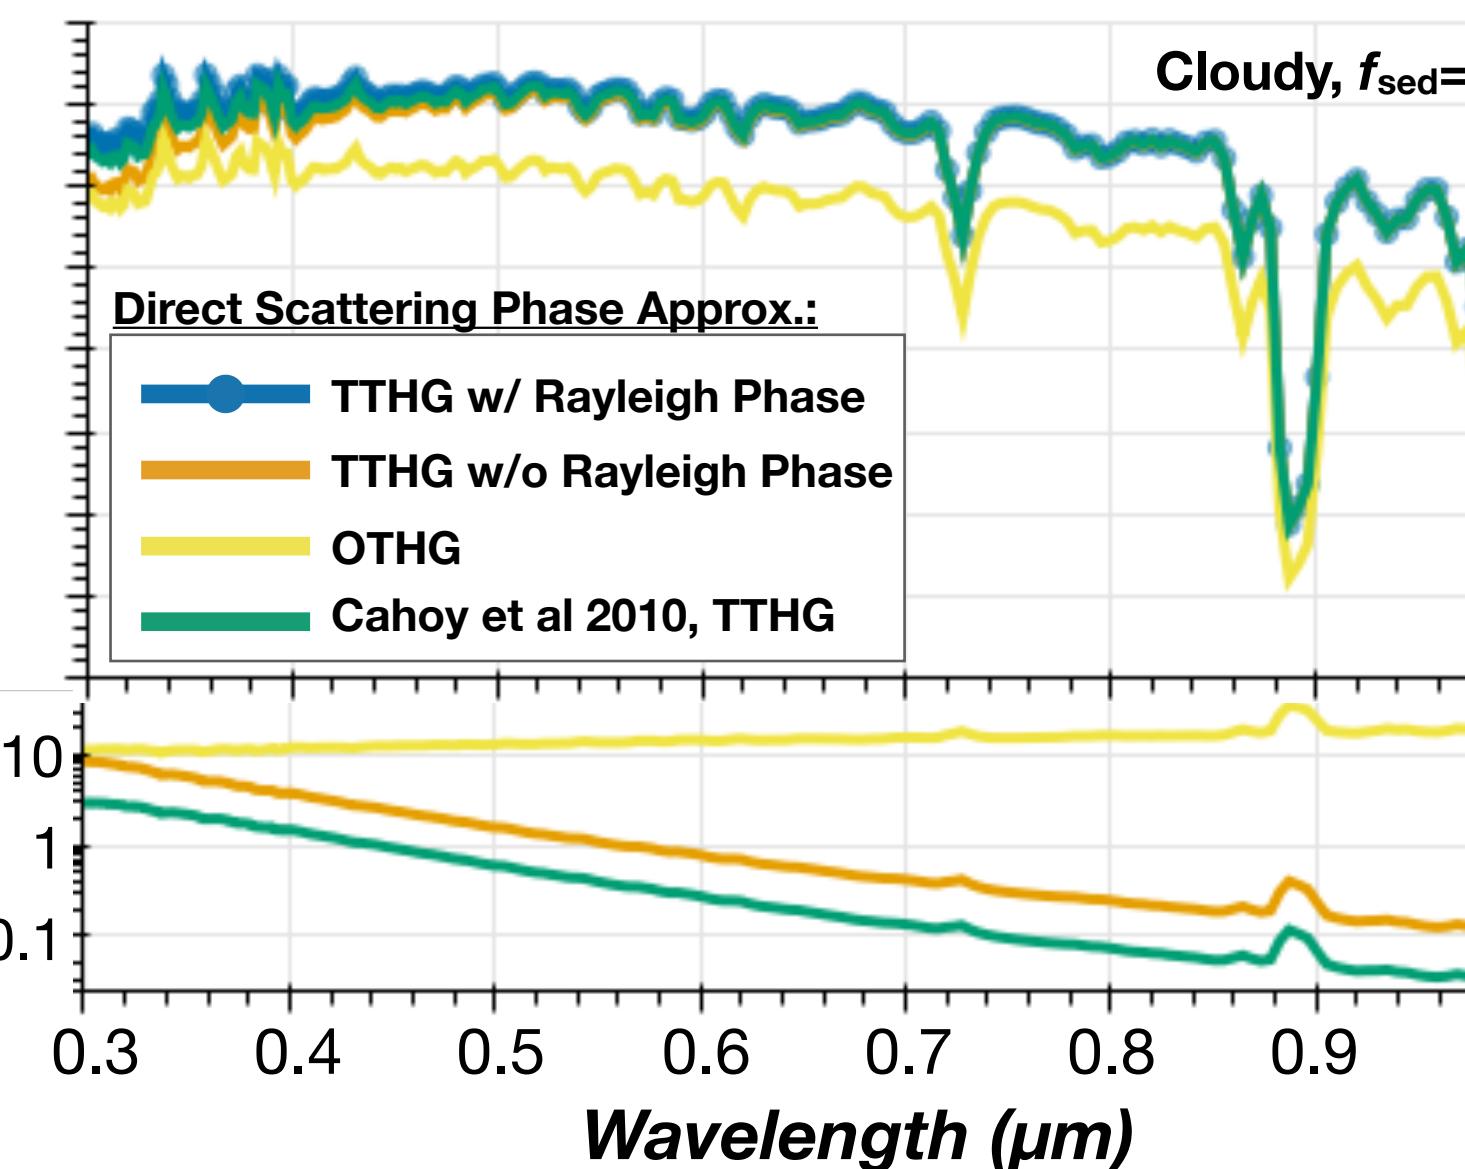

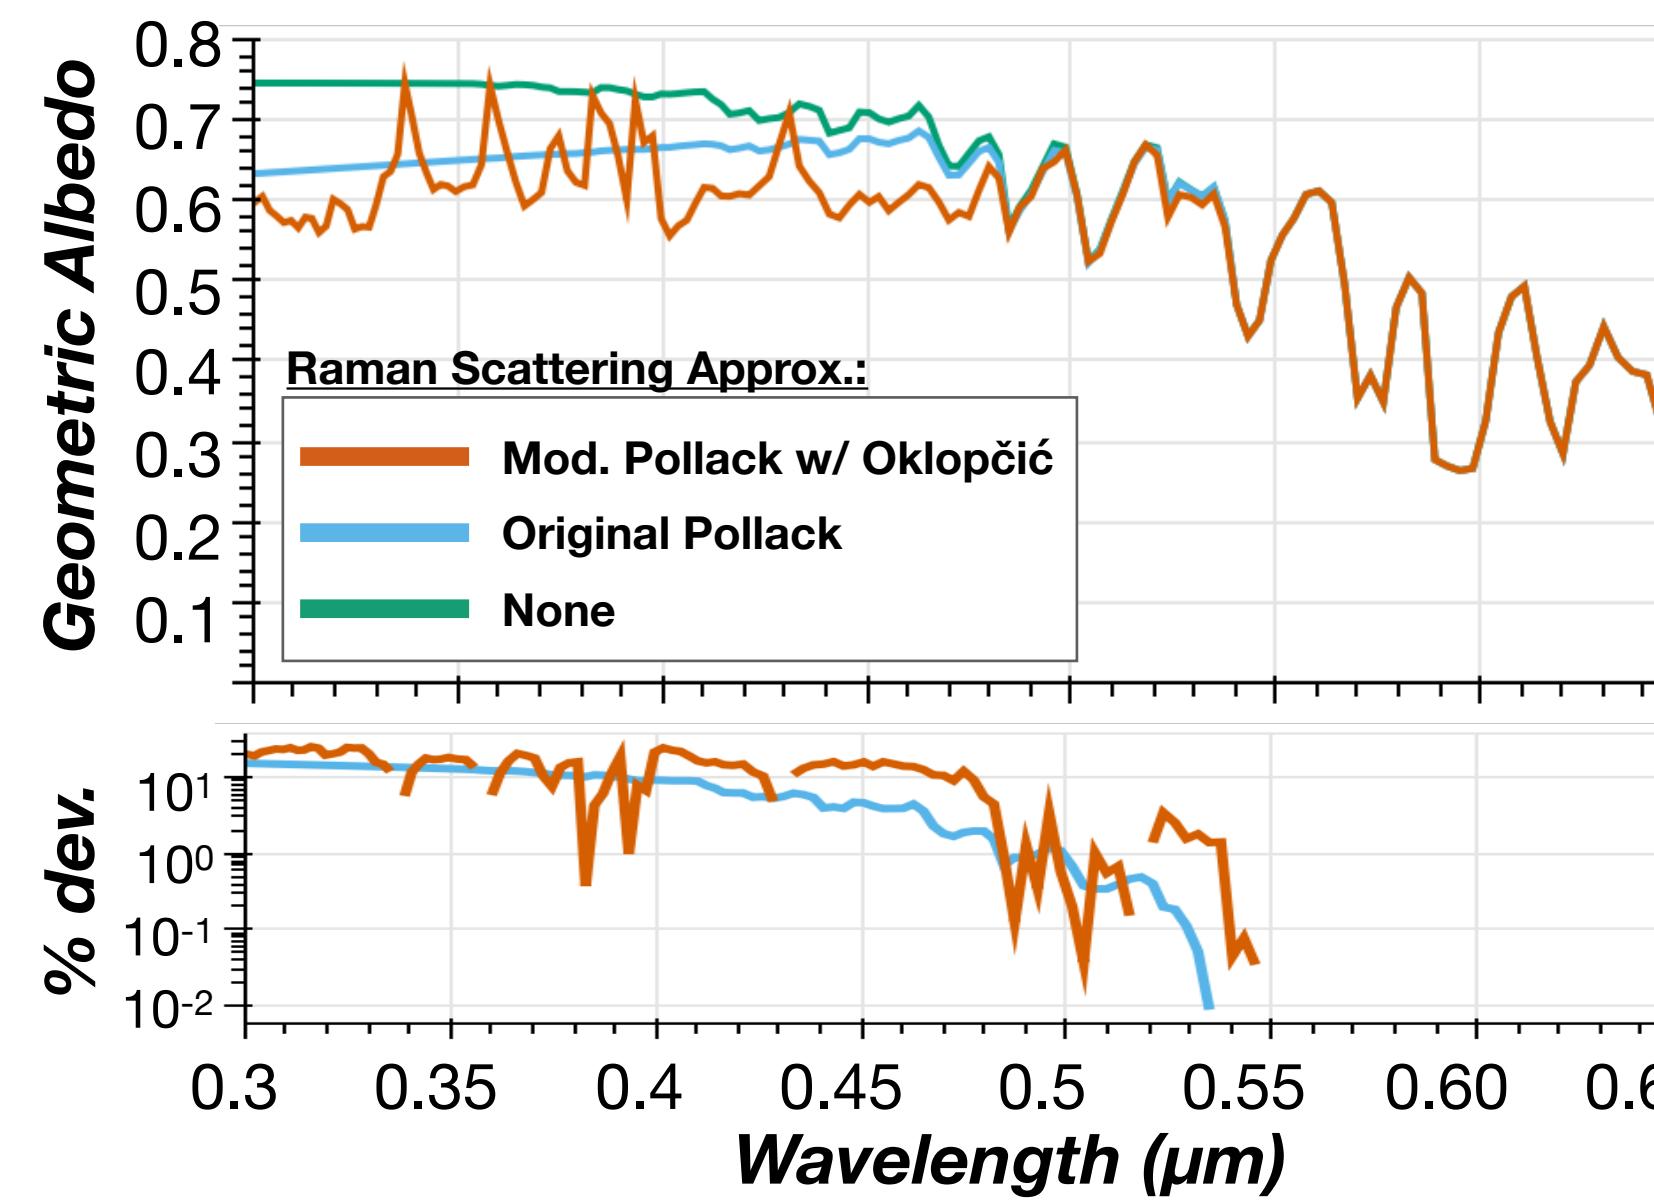

CODES AGREE MOSTLY WITHIN 10% EXCEPT AT HIGH ASYMMETRY OR LOWER SSA

CAN'T BASELINE TO OTHER CODES IF YOU CAN'T COMPARE APPLES TO APPLES

# COMBATING COMPLEXITY WITH TRANSPARENT ASSUMPTIONS

```
In [3]: print('Options for Direct Scattring Phase: ', jdi.single_phase_options())
print('Options for Multiple Scattring Phase: ', jdi.multi_phase_options())
print('Options for Raman Scattring: ', jdi.raman_options())
```

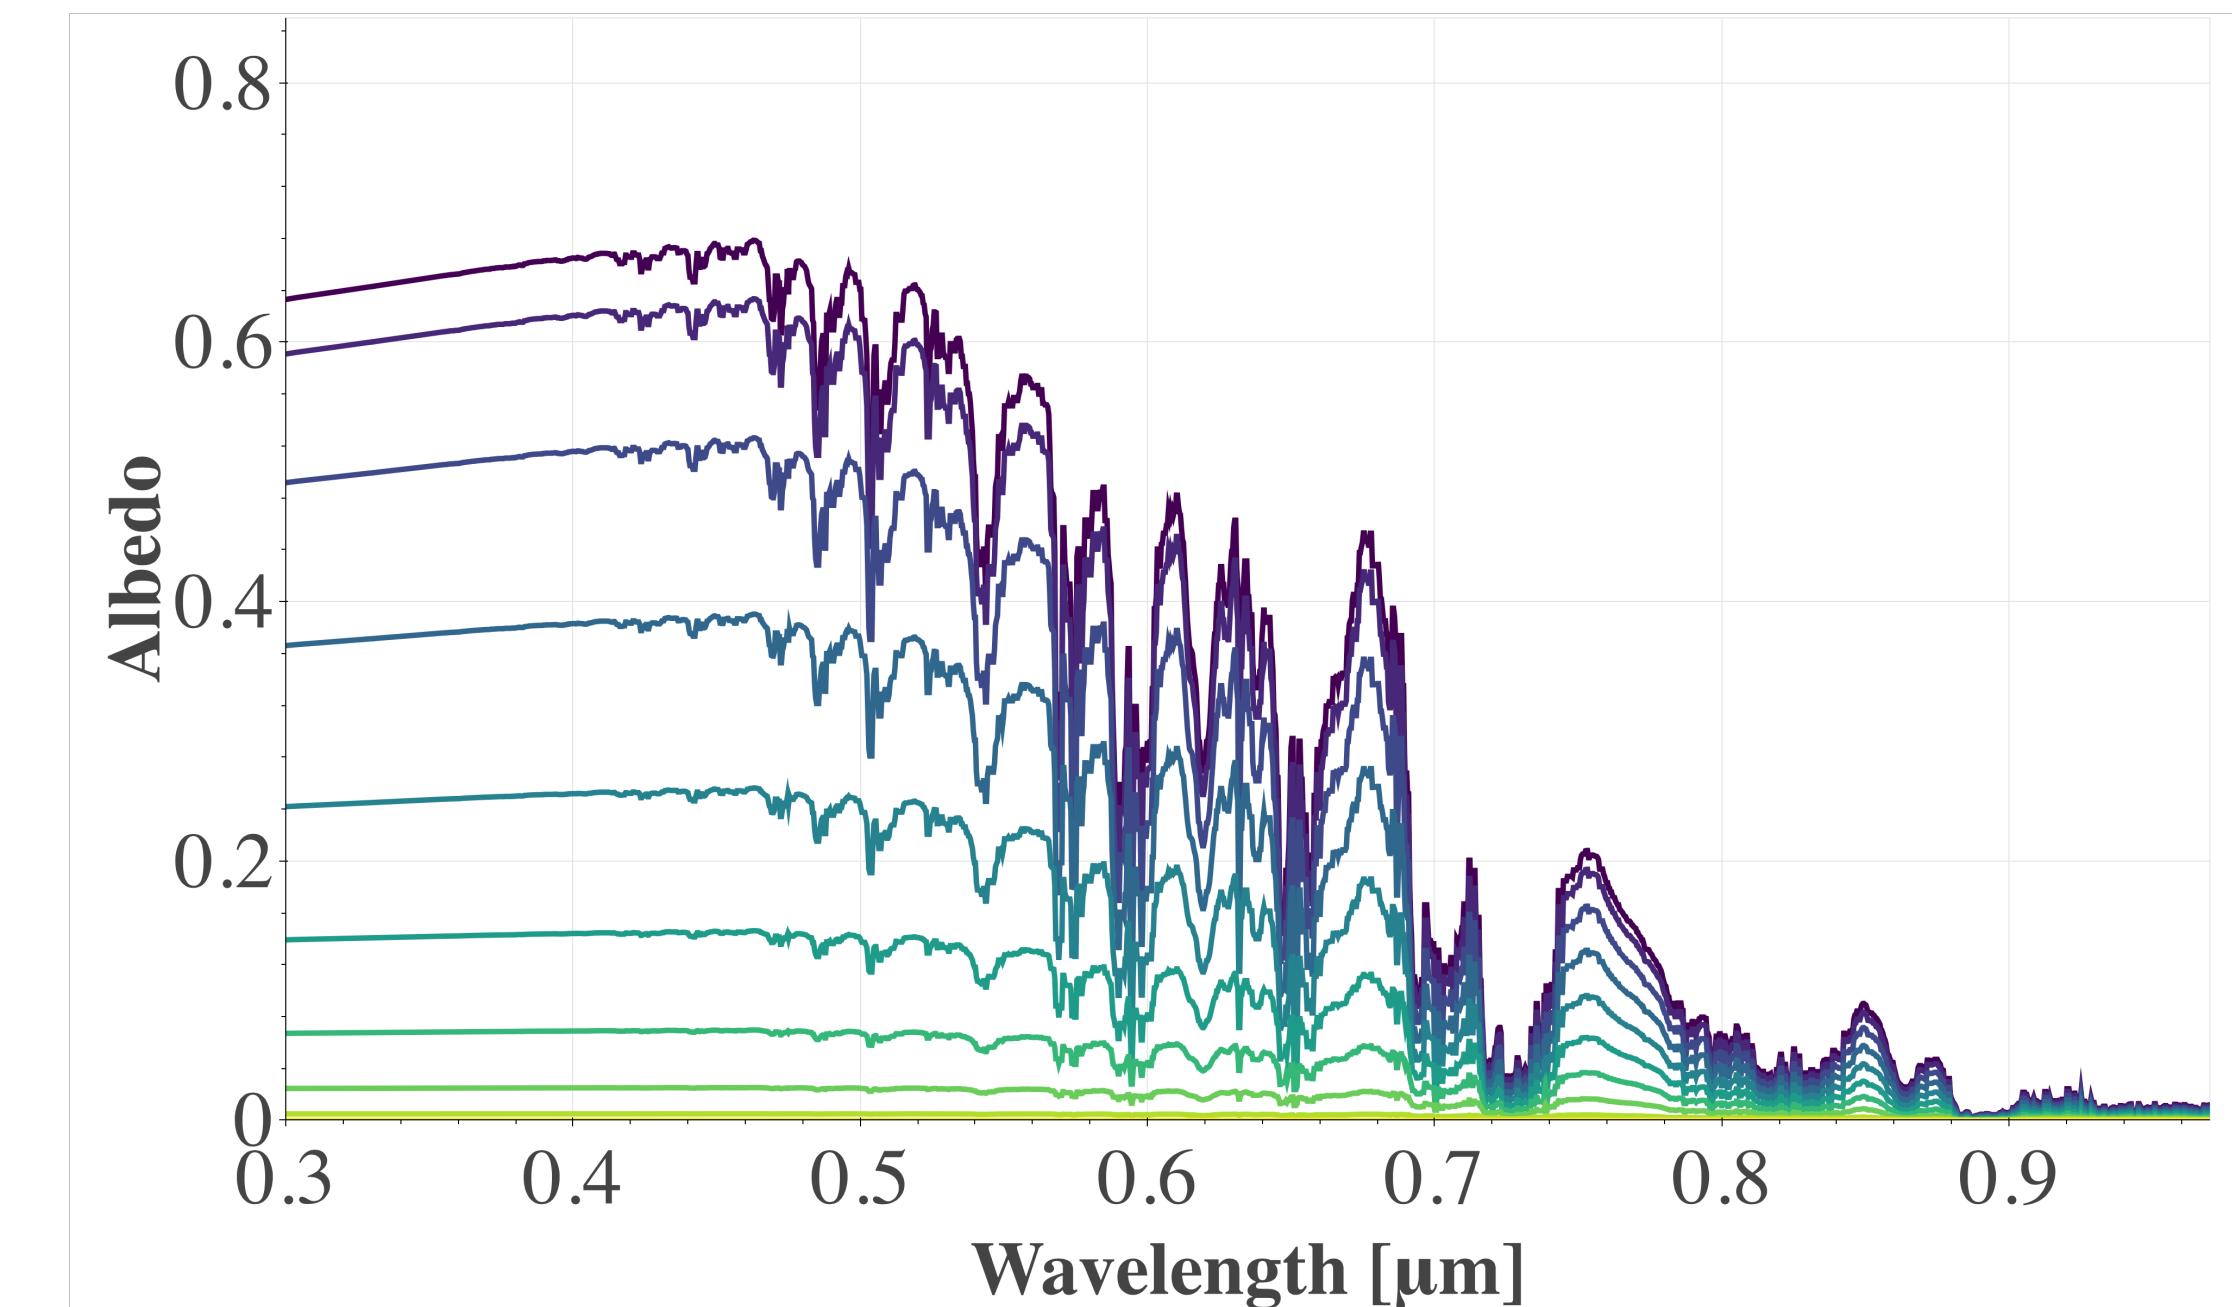

Can also set functional form of forward/back scattering in approx['TTHG\_params']  
 Options for Direct Scattring Phase: ['cahoy', 'OTHG', 'TTHG', 'TTHG\_ray']  
 Can also set delta\_eddington=True/False in approx['delta\_eddington']  
 Options for Multiple Scattring Phase: ['N=2', 'N=1']  
 Options for Raman Scattring: ['oklopcic', 'pollack', 'none']

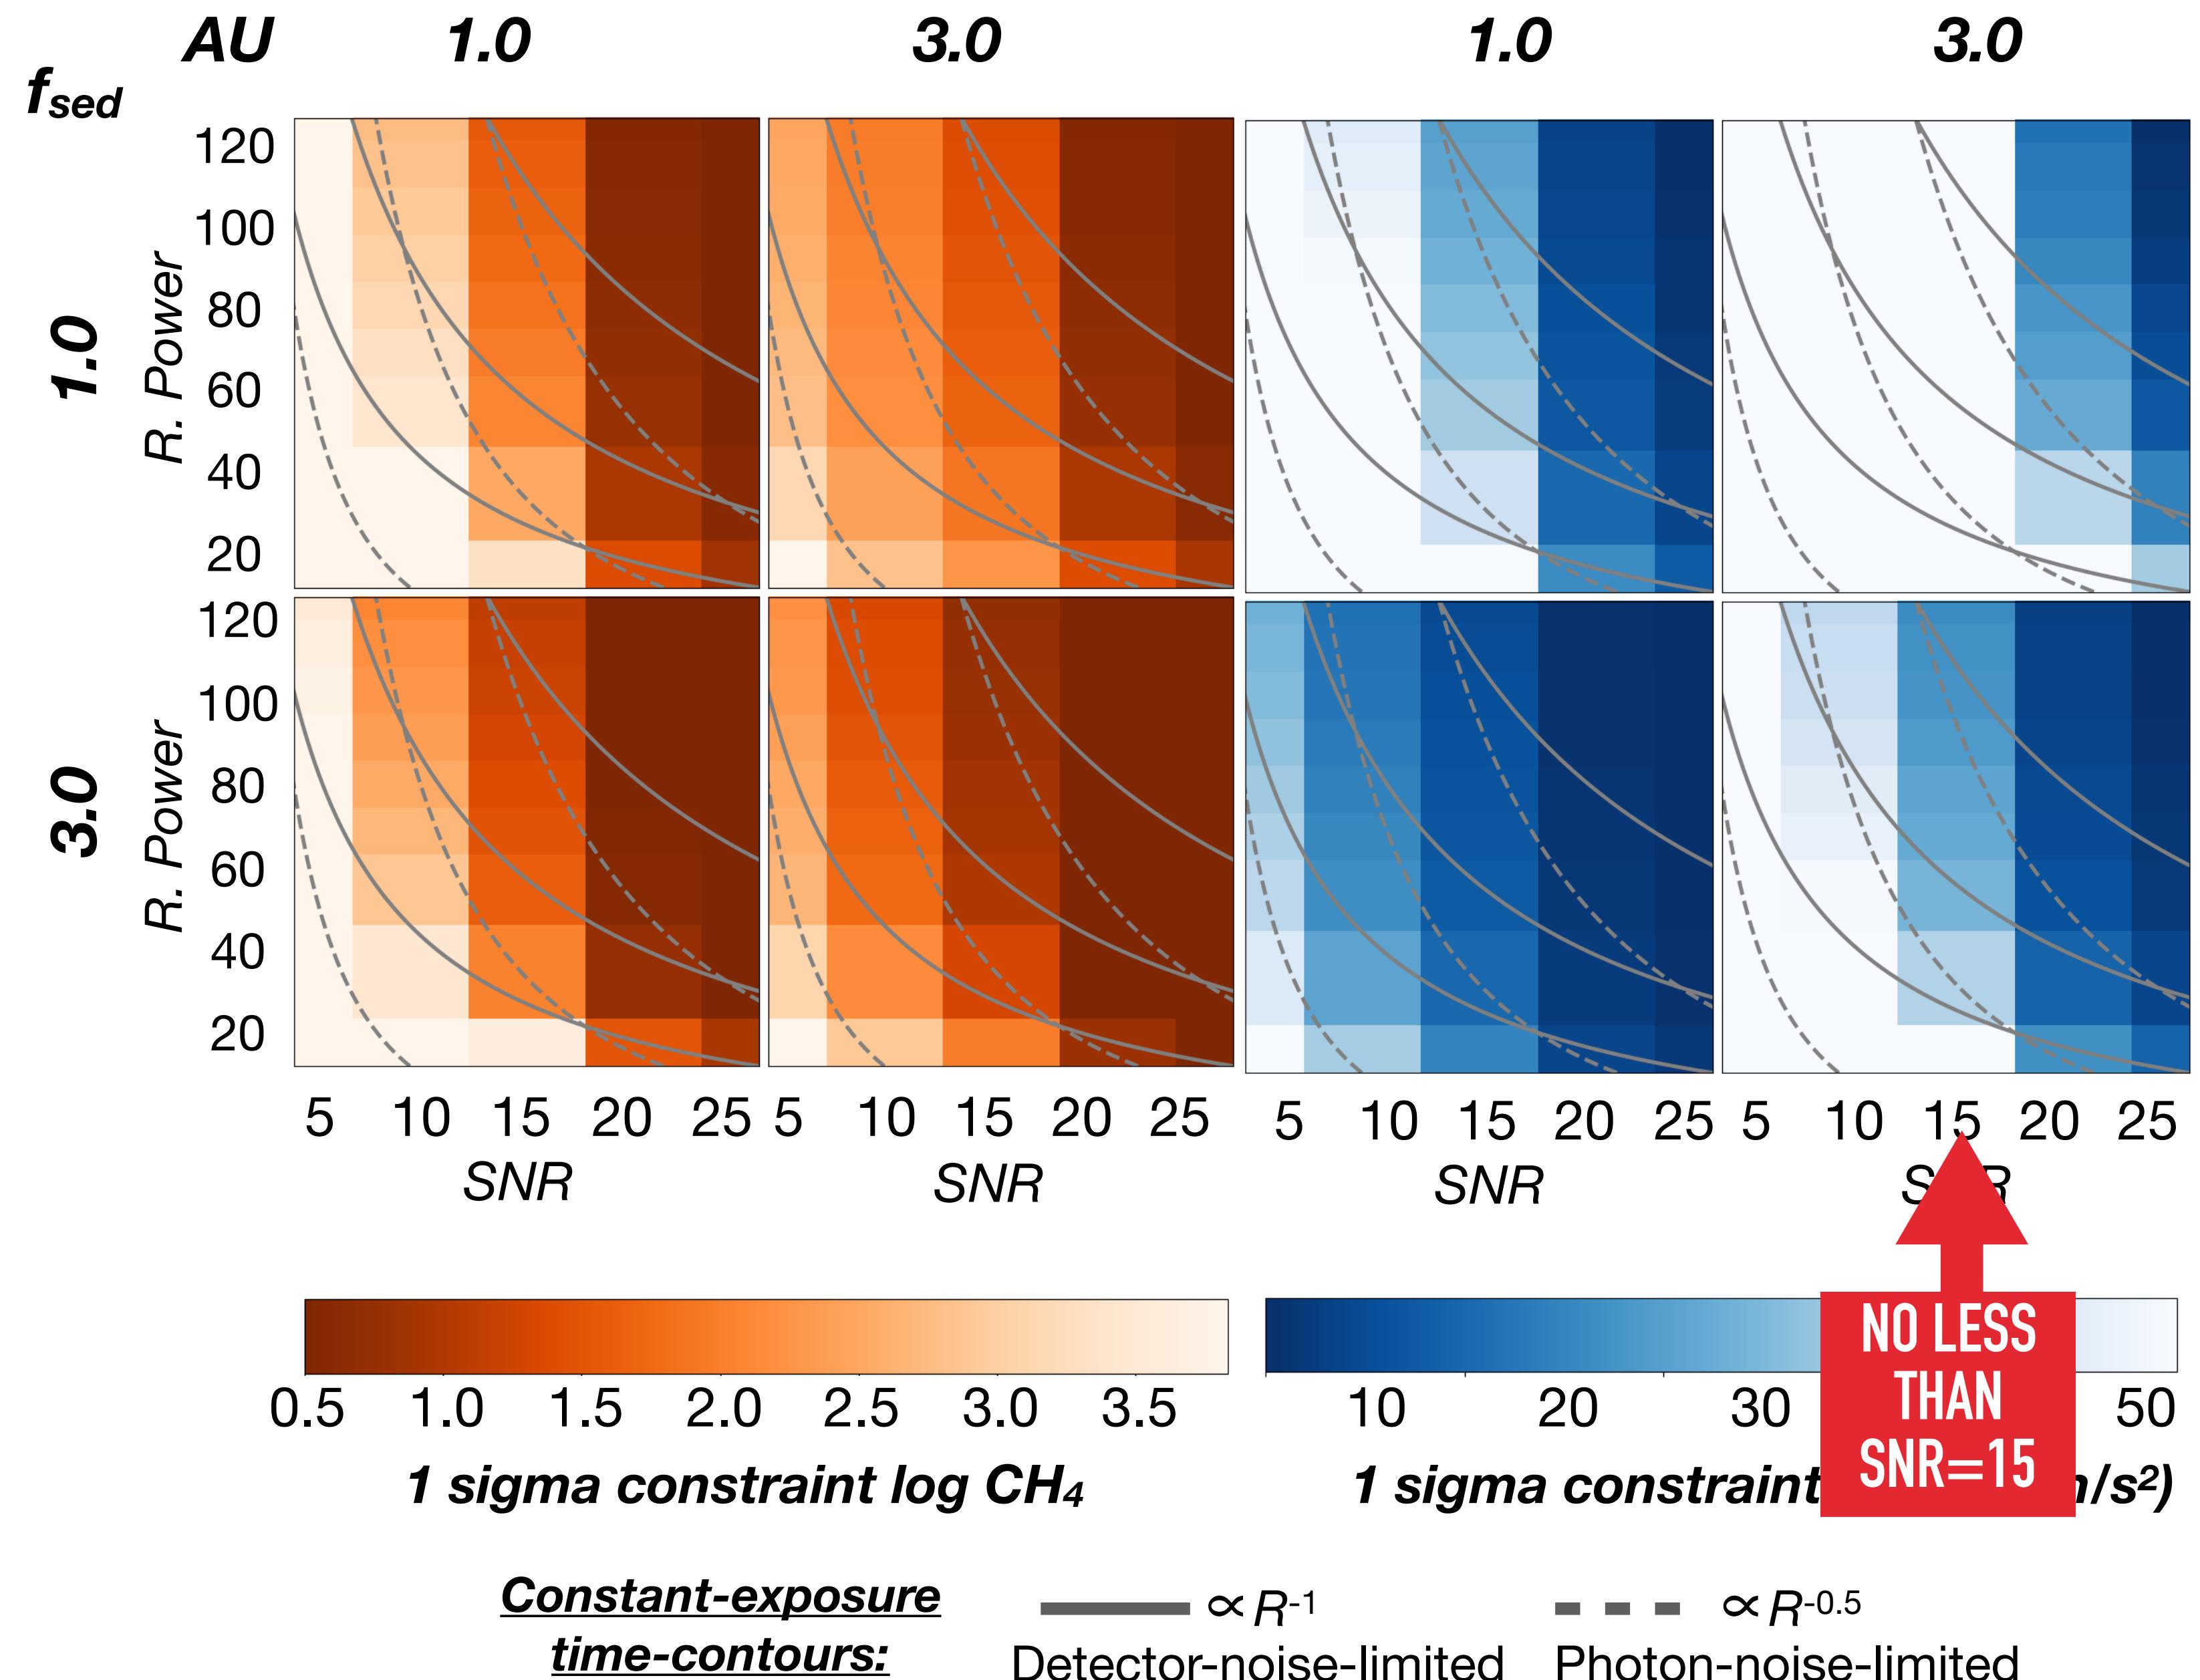

## COMPUTATION OF PHASE-DEPENDENT REFLECTED LIGHT SPECTROSCOPY WITH...

- ▶ ***Highly accessible! Yay!***
- ▶ ***Robust and Testable! Yay!***
- ▶ ***Clearly defined assumptions! Yay!***

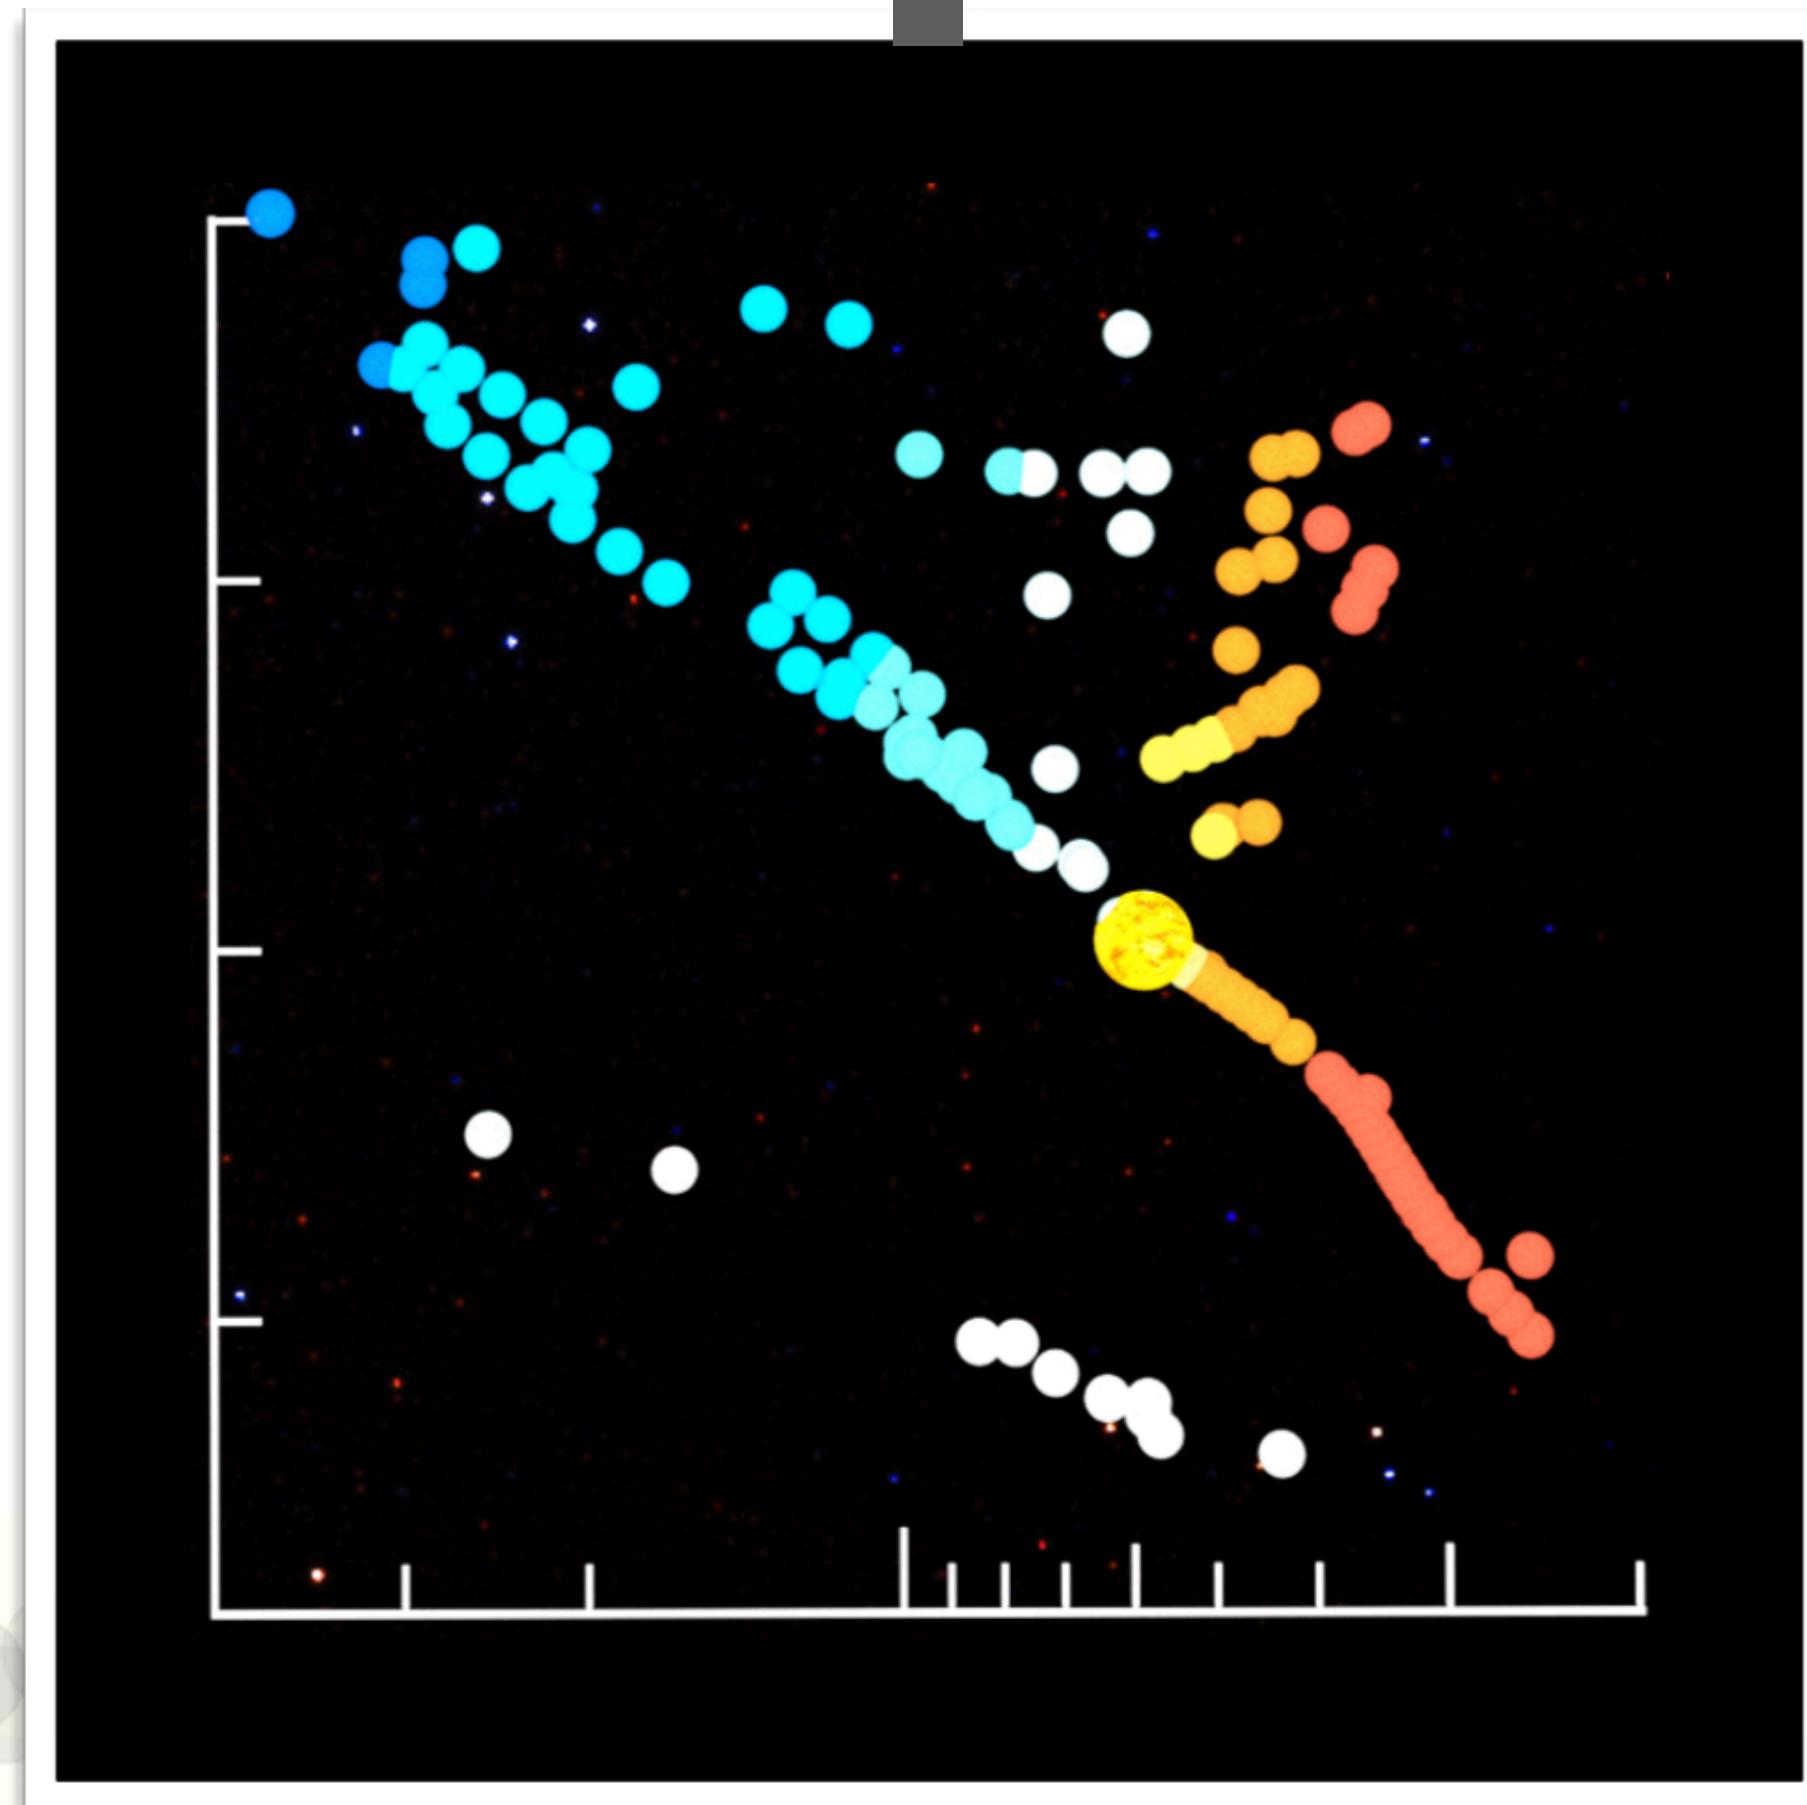

## PICASO + INFORMATION CONTENT THEORY TO ASSESS MISSION DESIGN OBJECTIVES

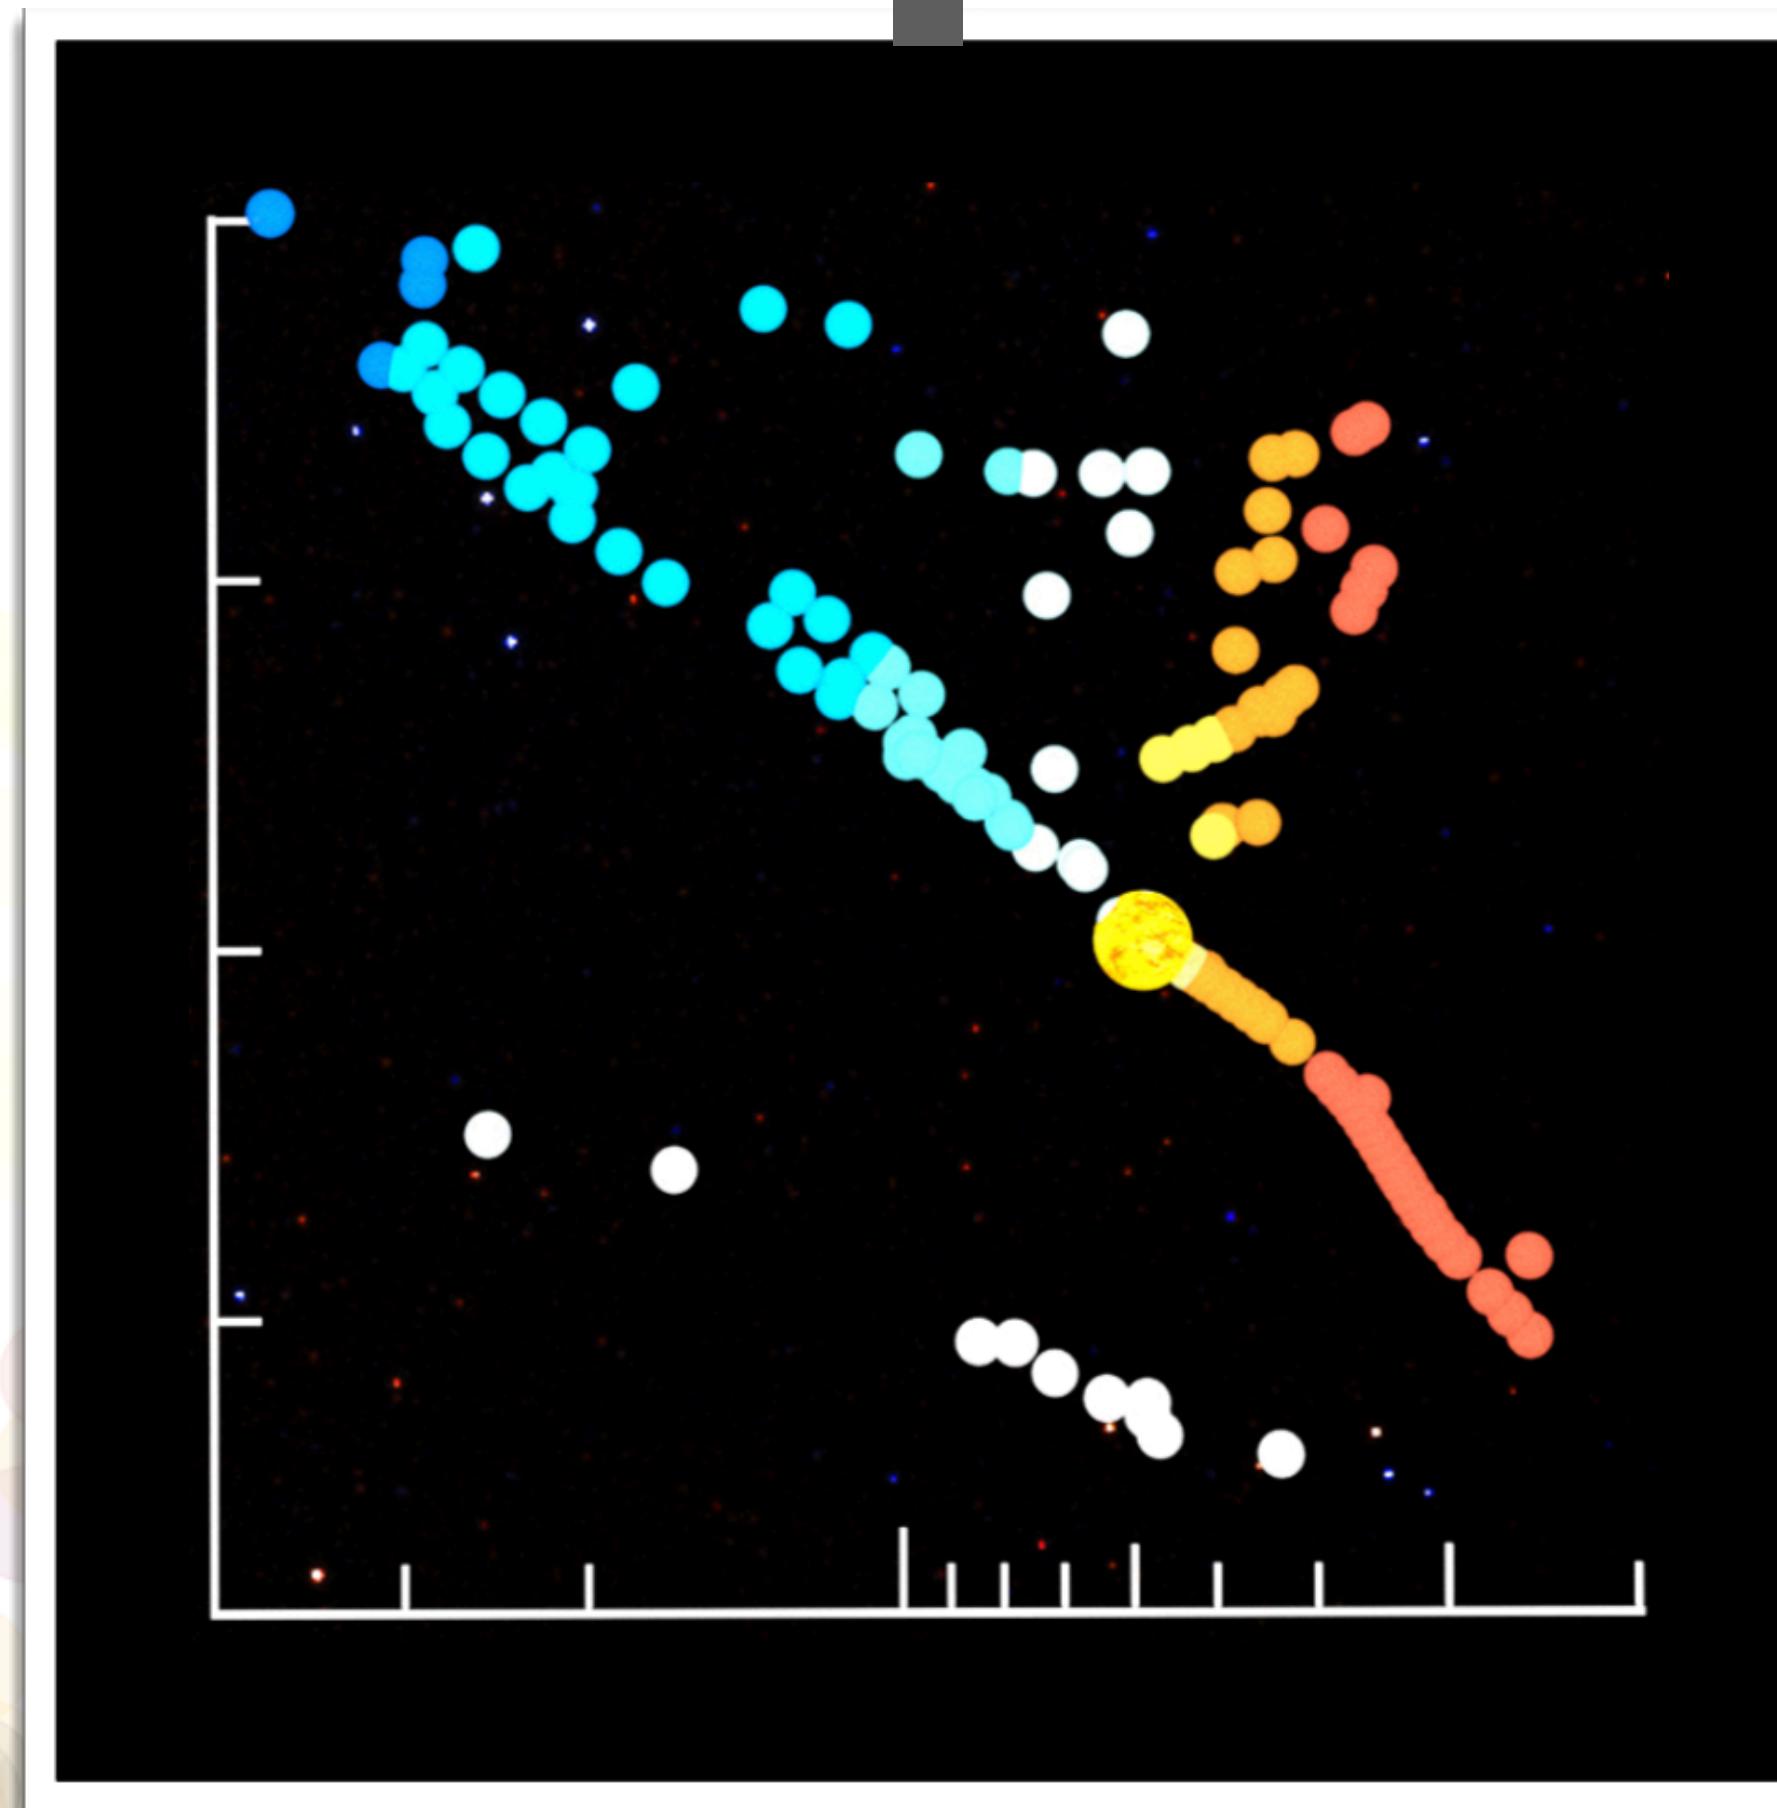

**Currently using these techniques for WFIRST filter assessment.**

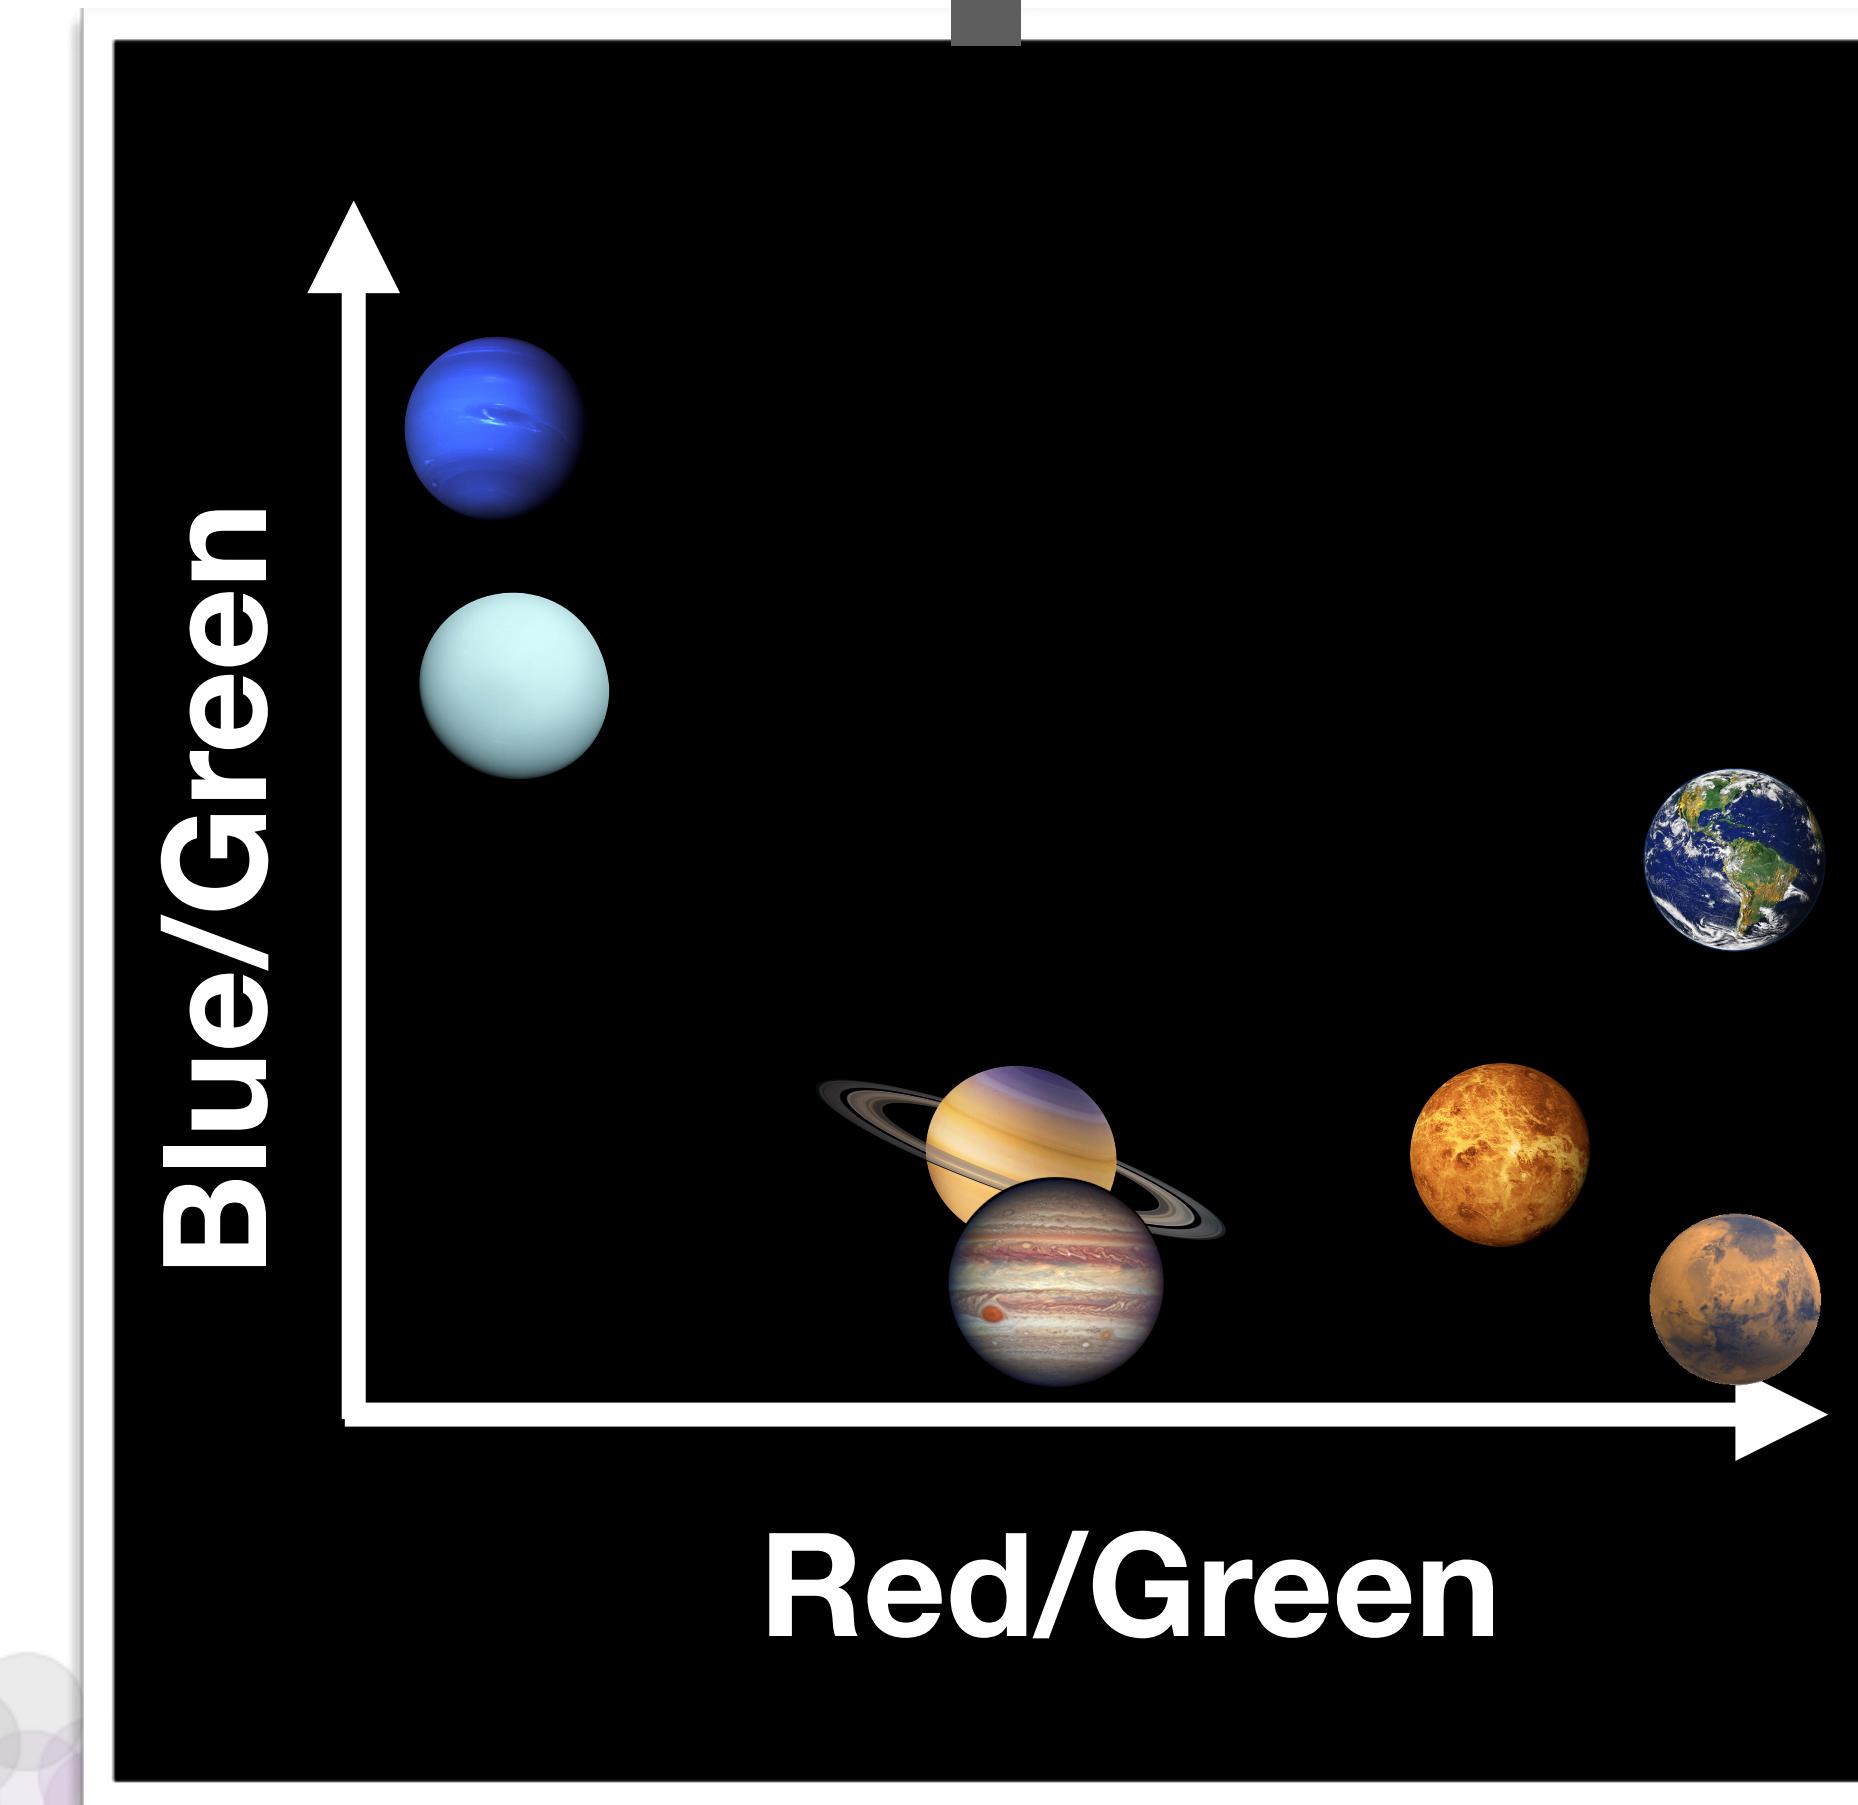

# HR Diagram

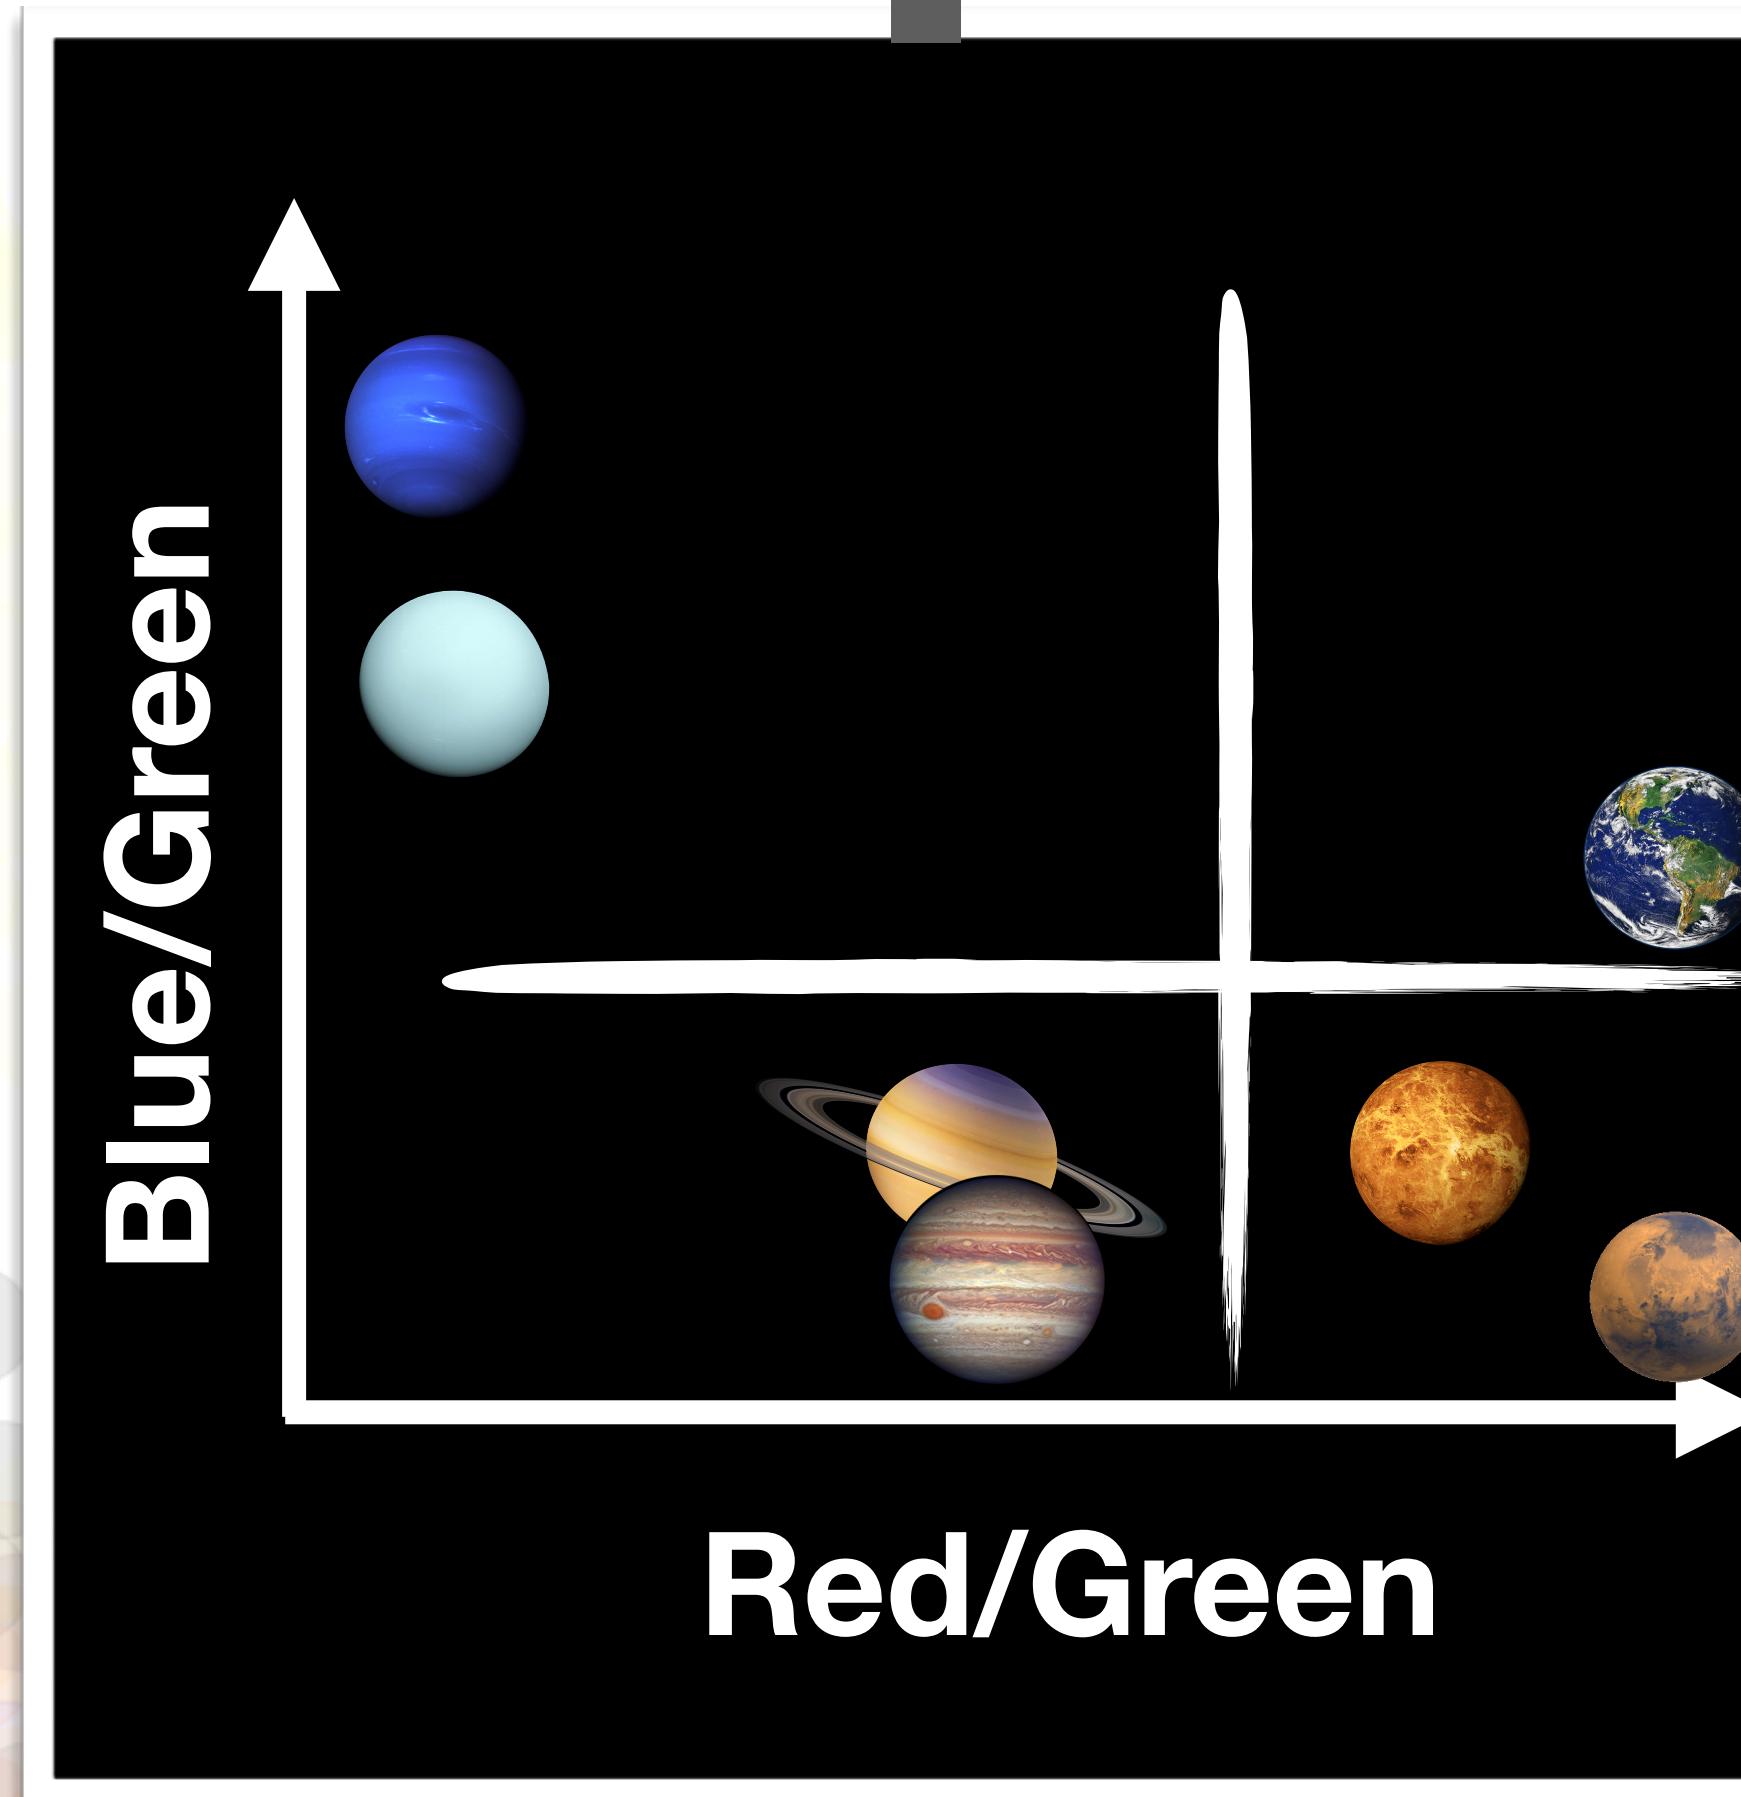

# HR Diagram

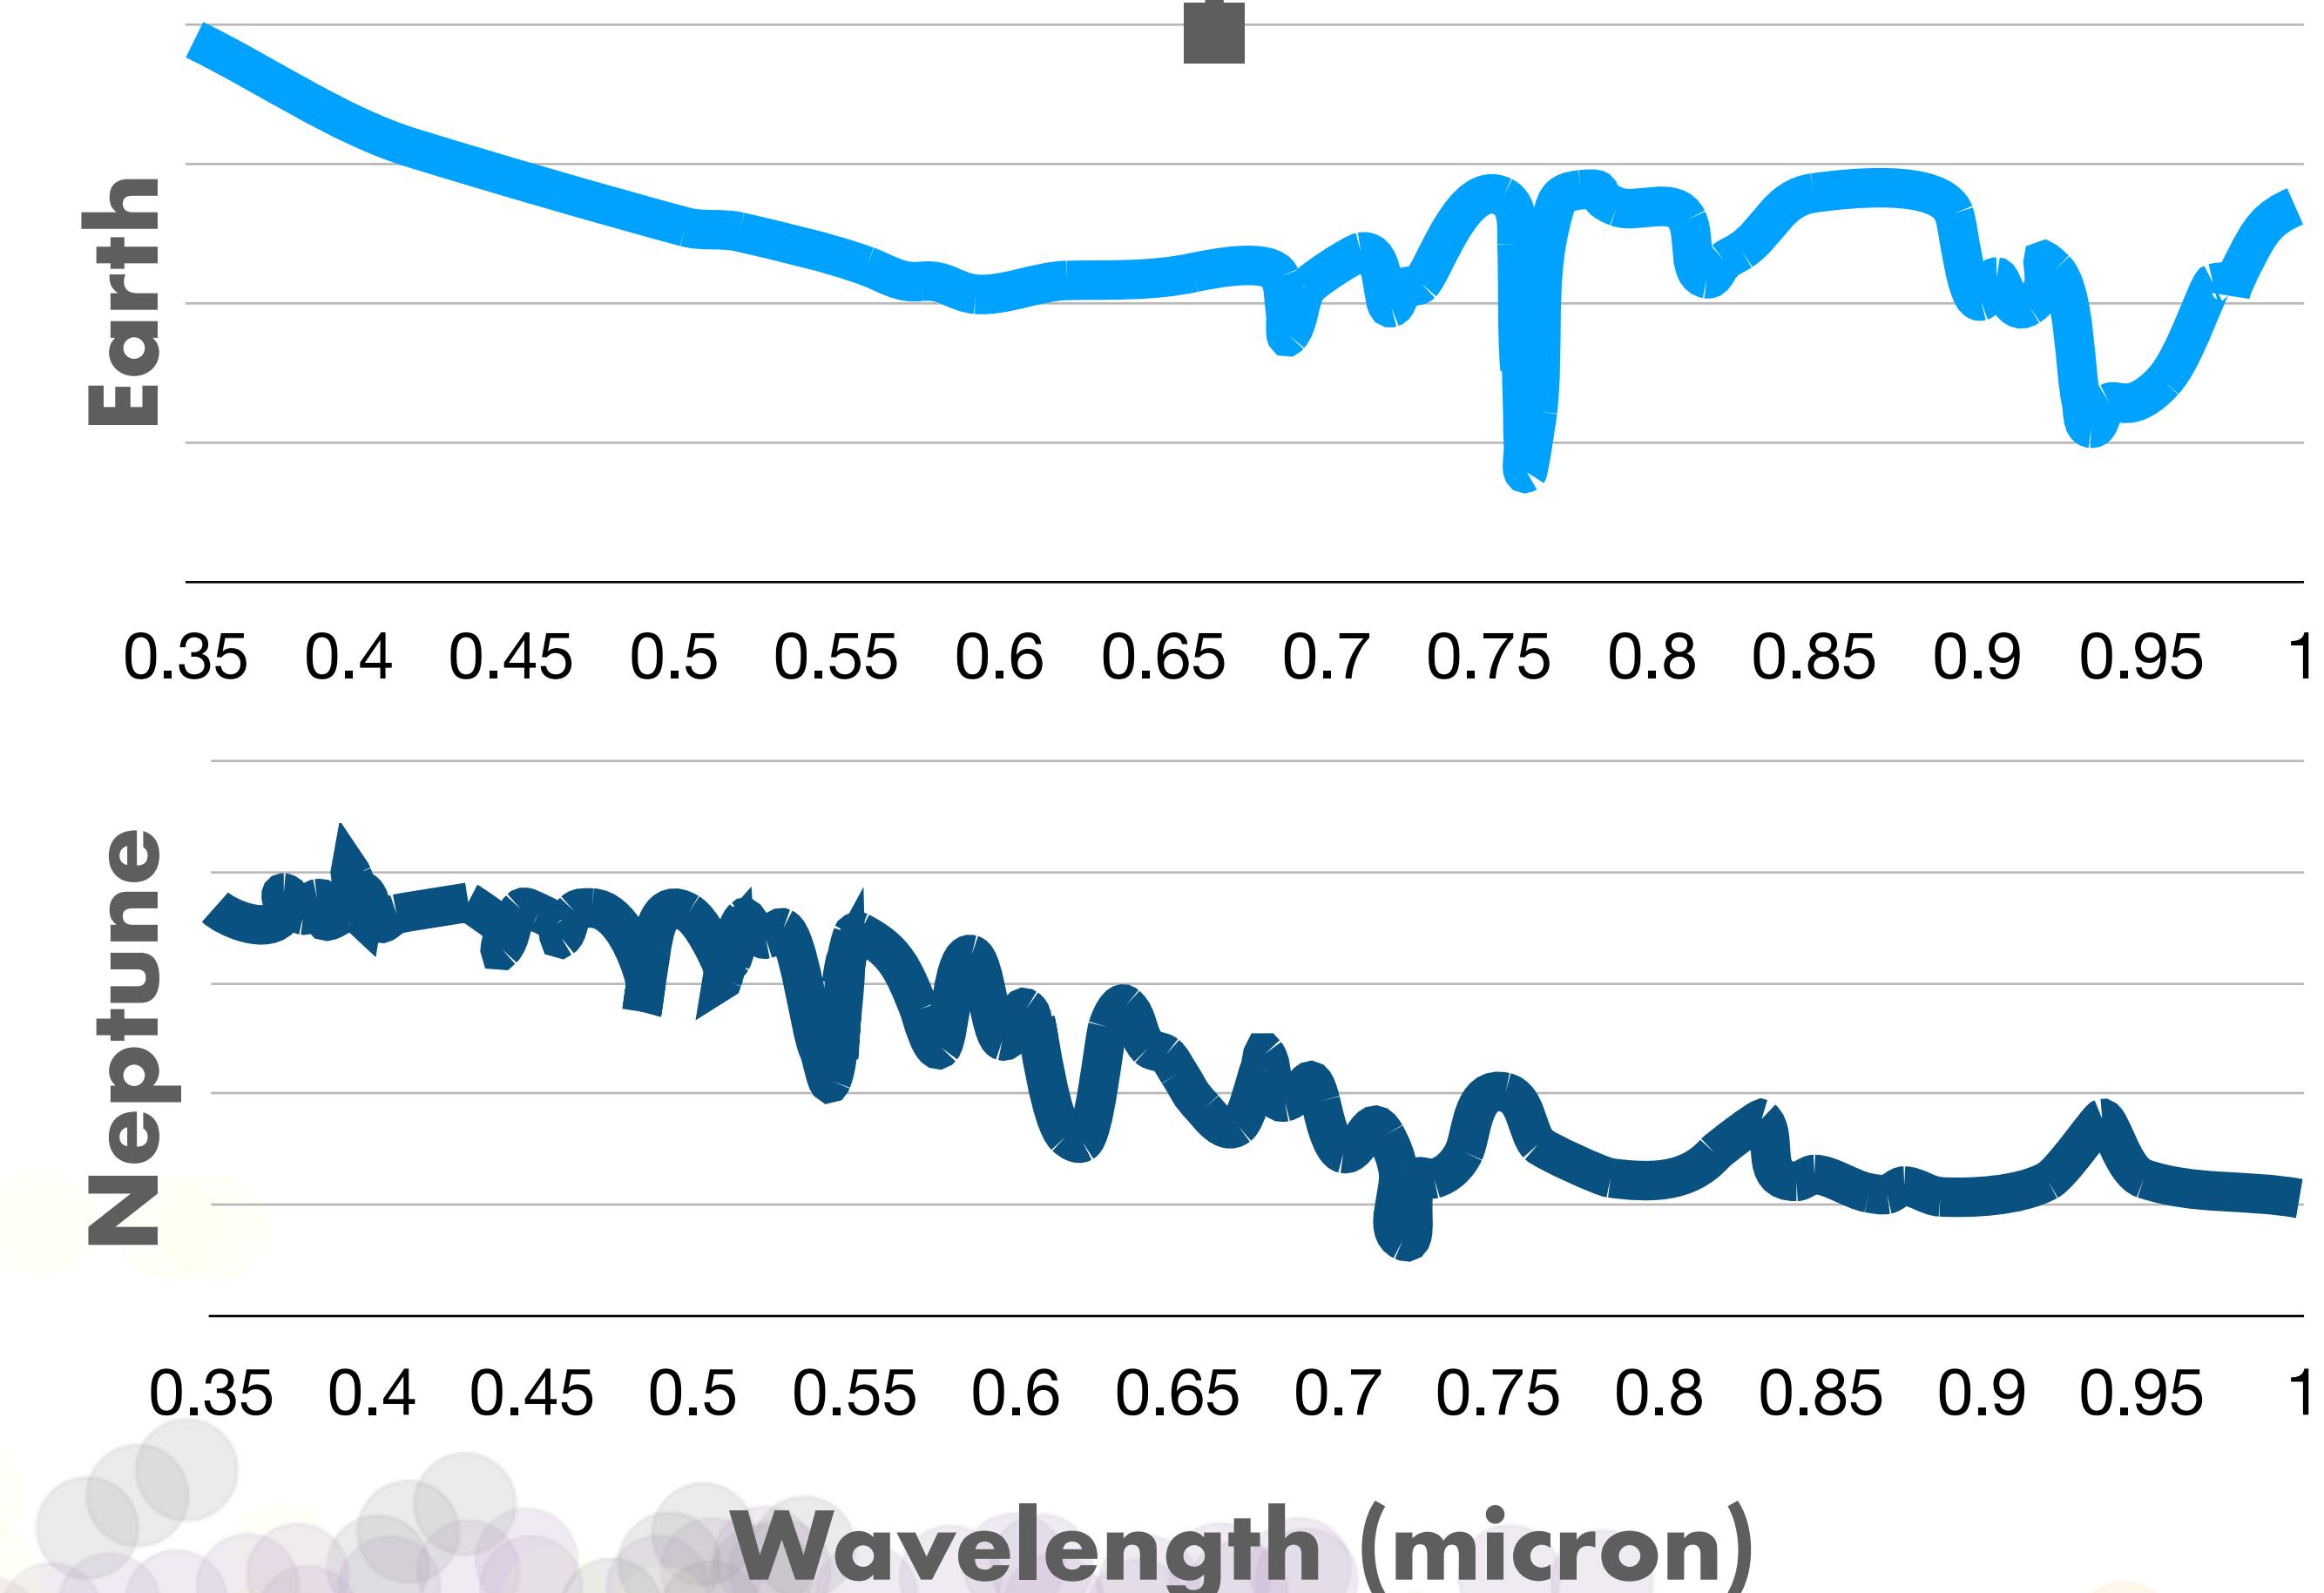

# Solar System

# Solar System

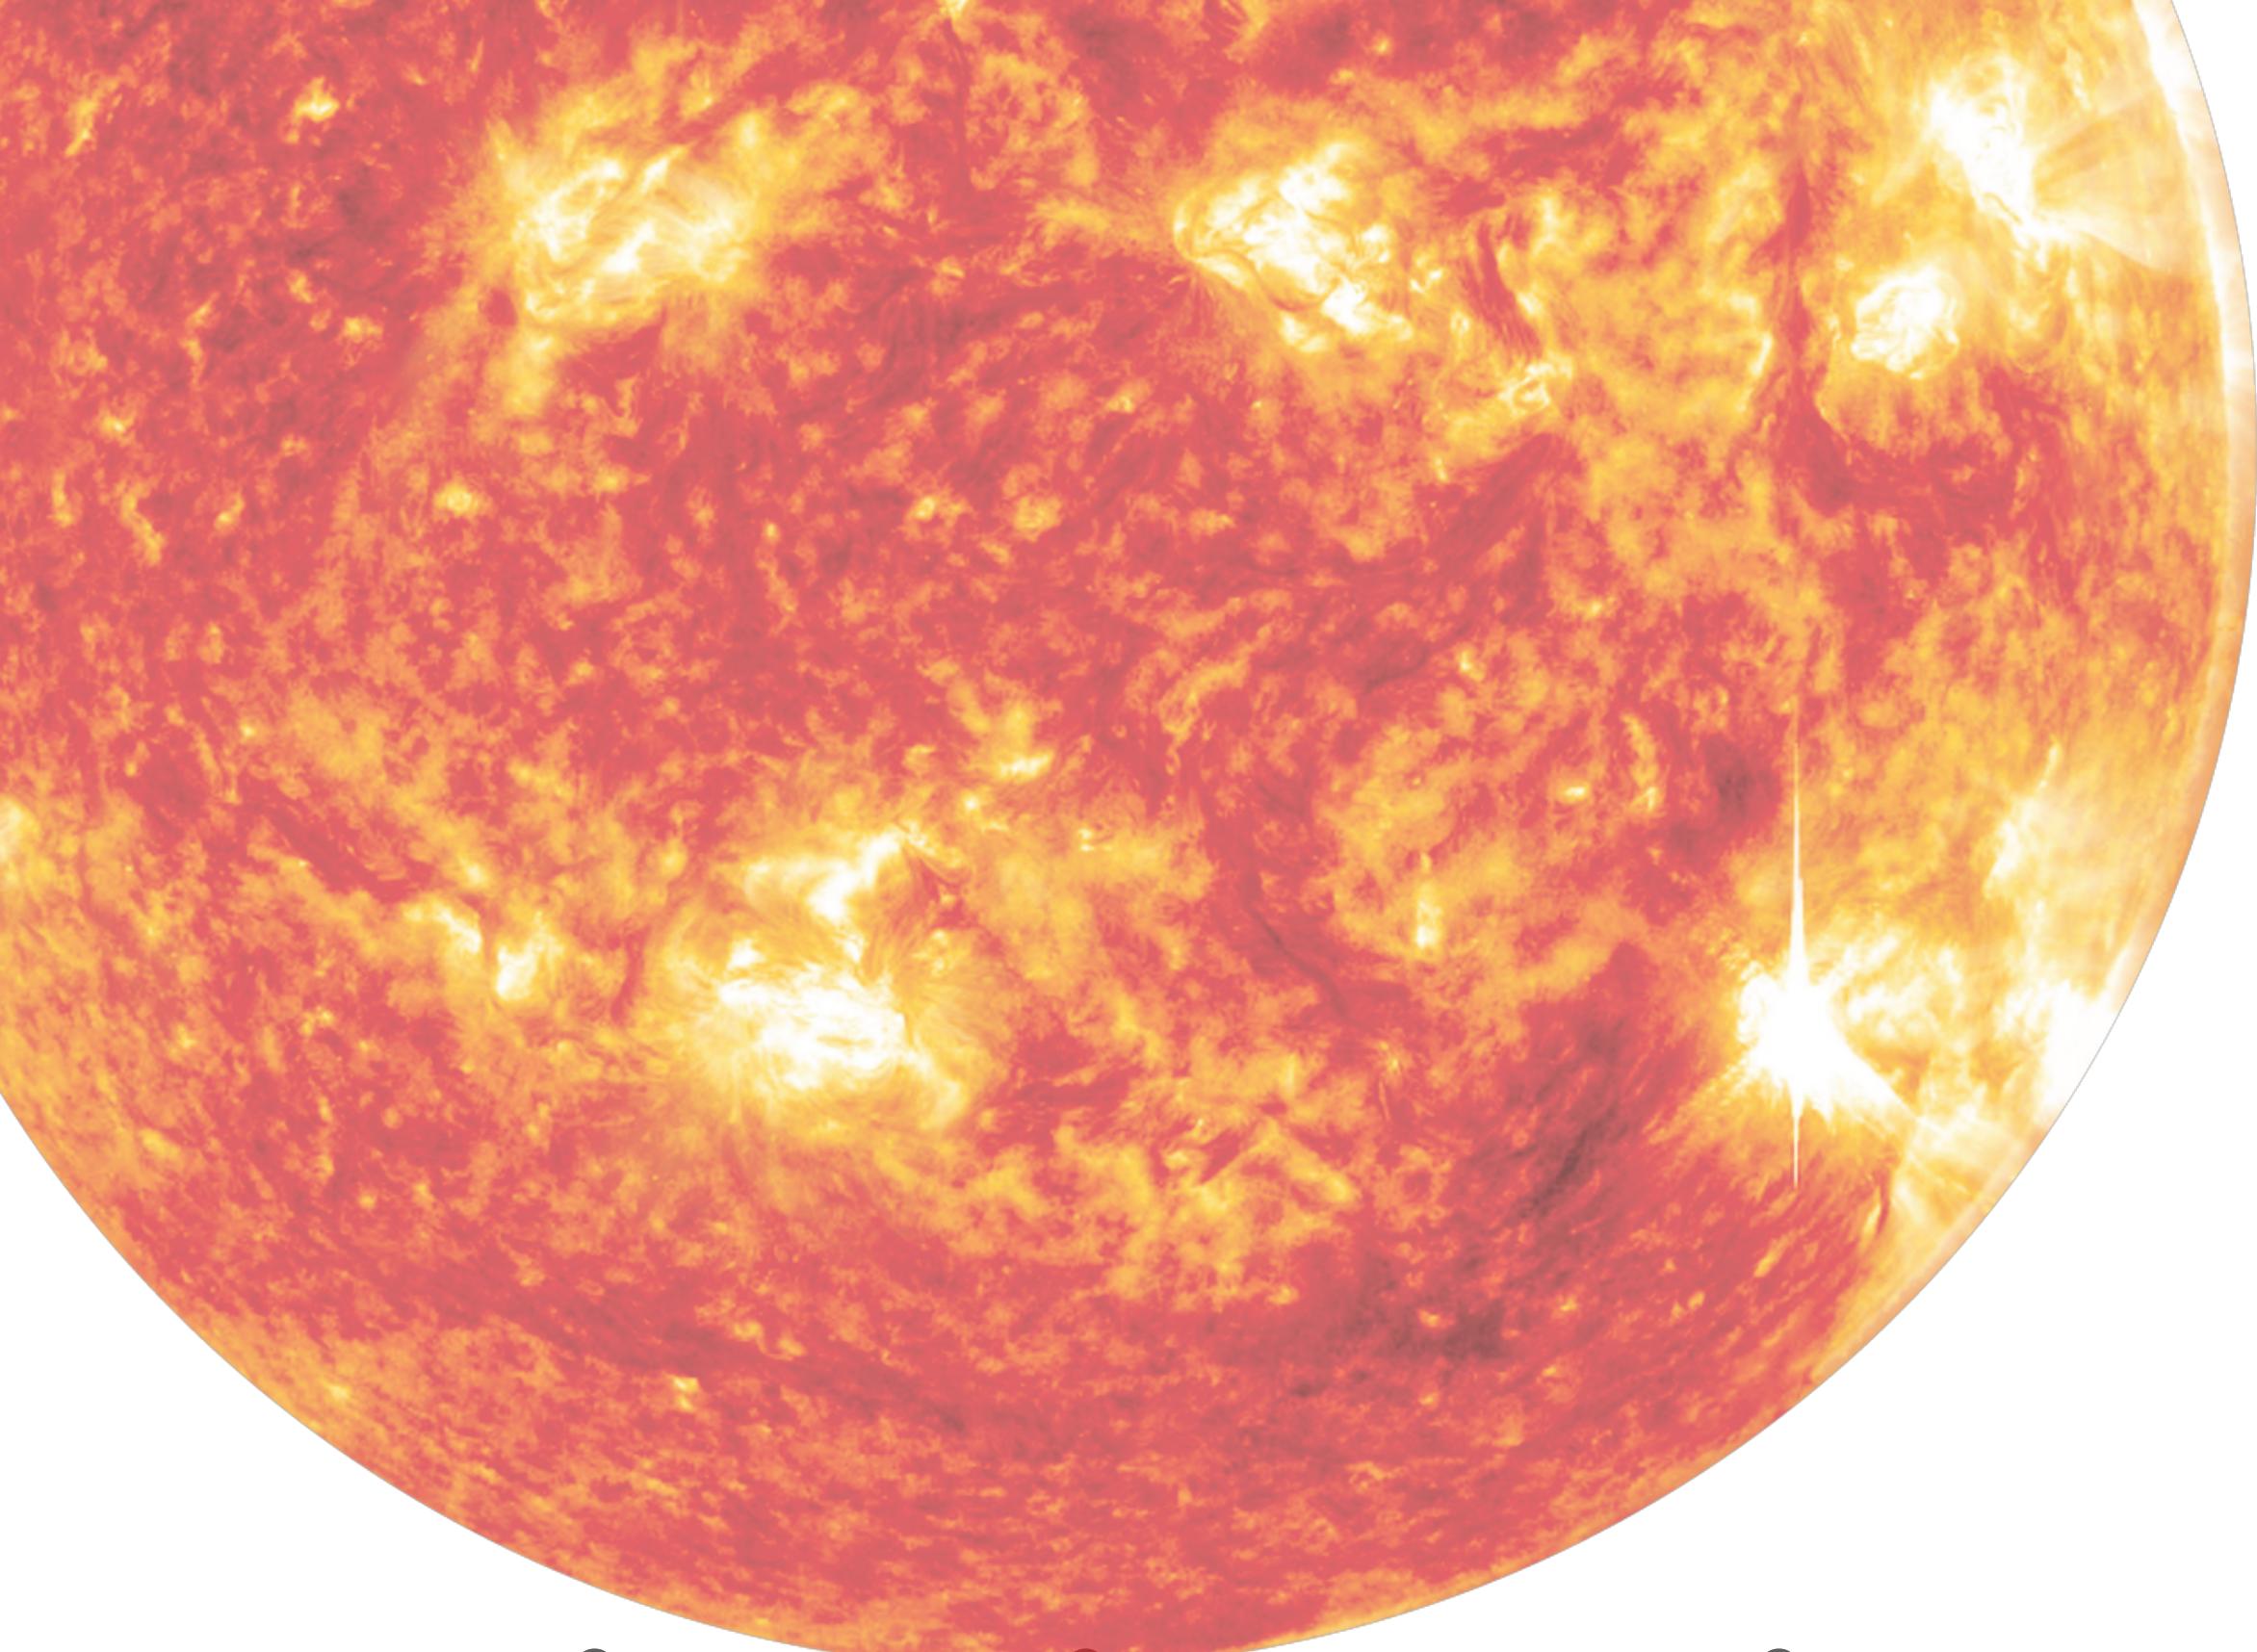

# Pale Blue Dot

# Goals:

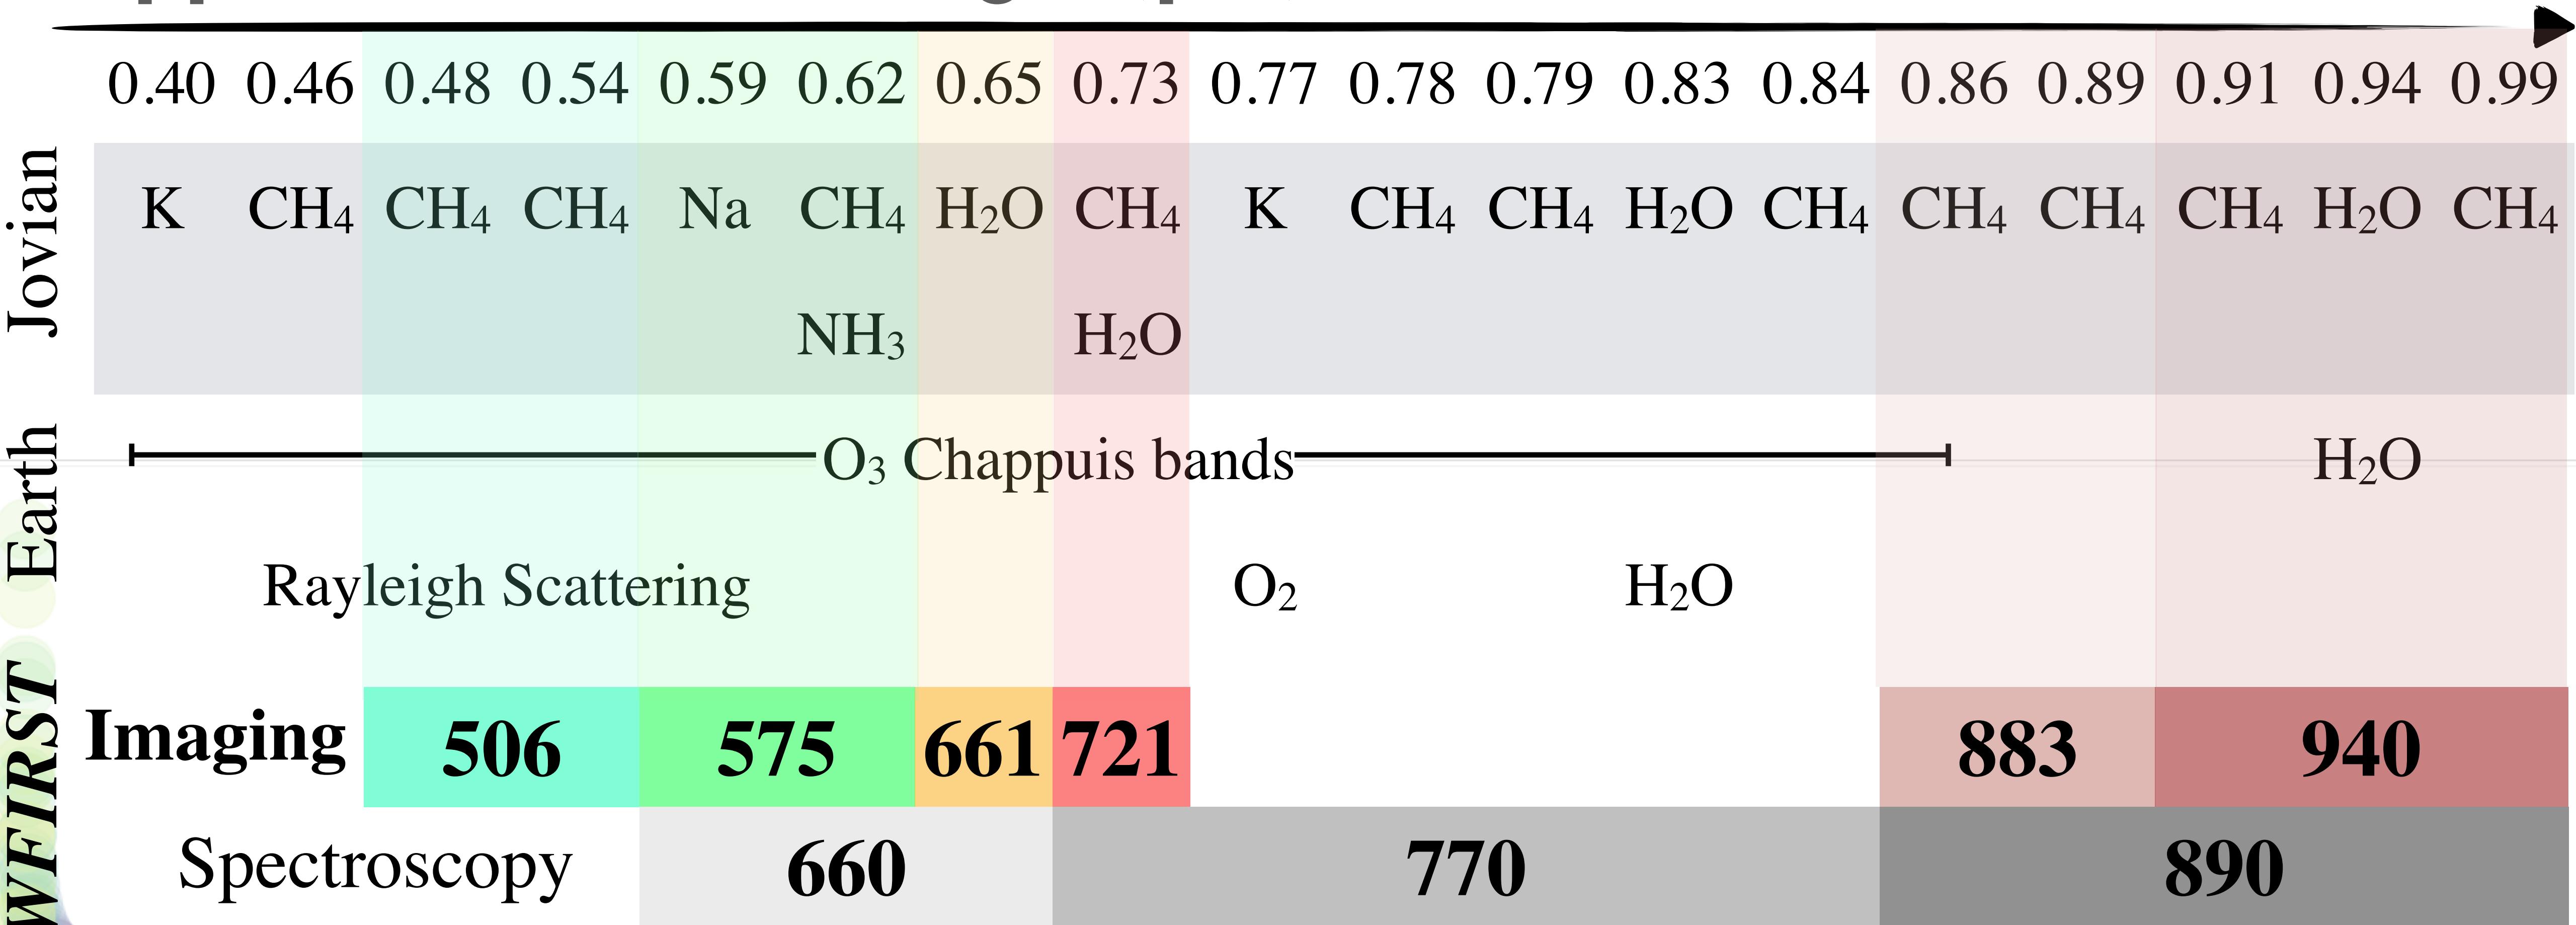

---

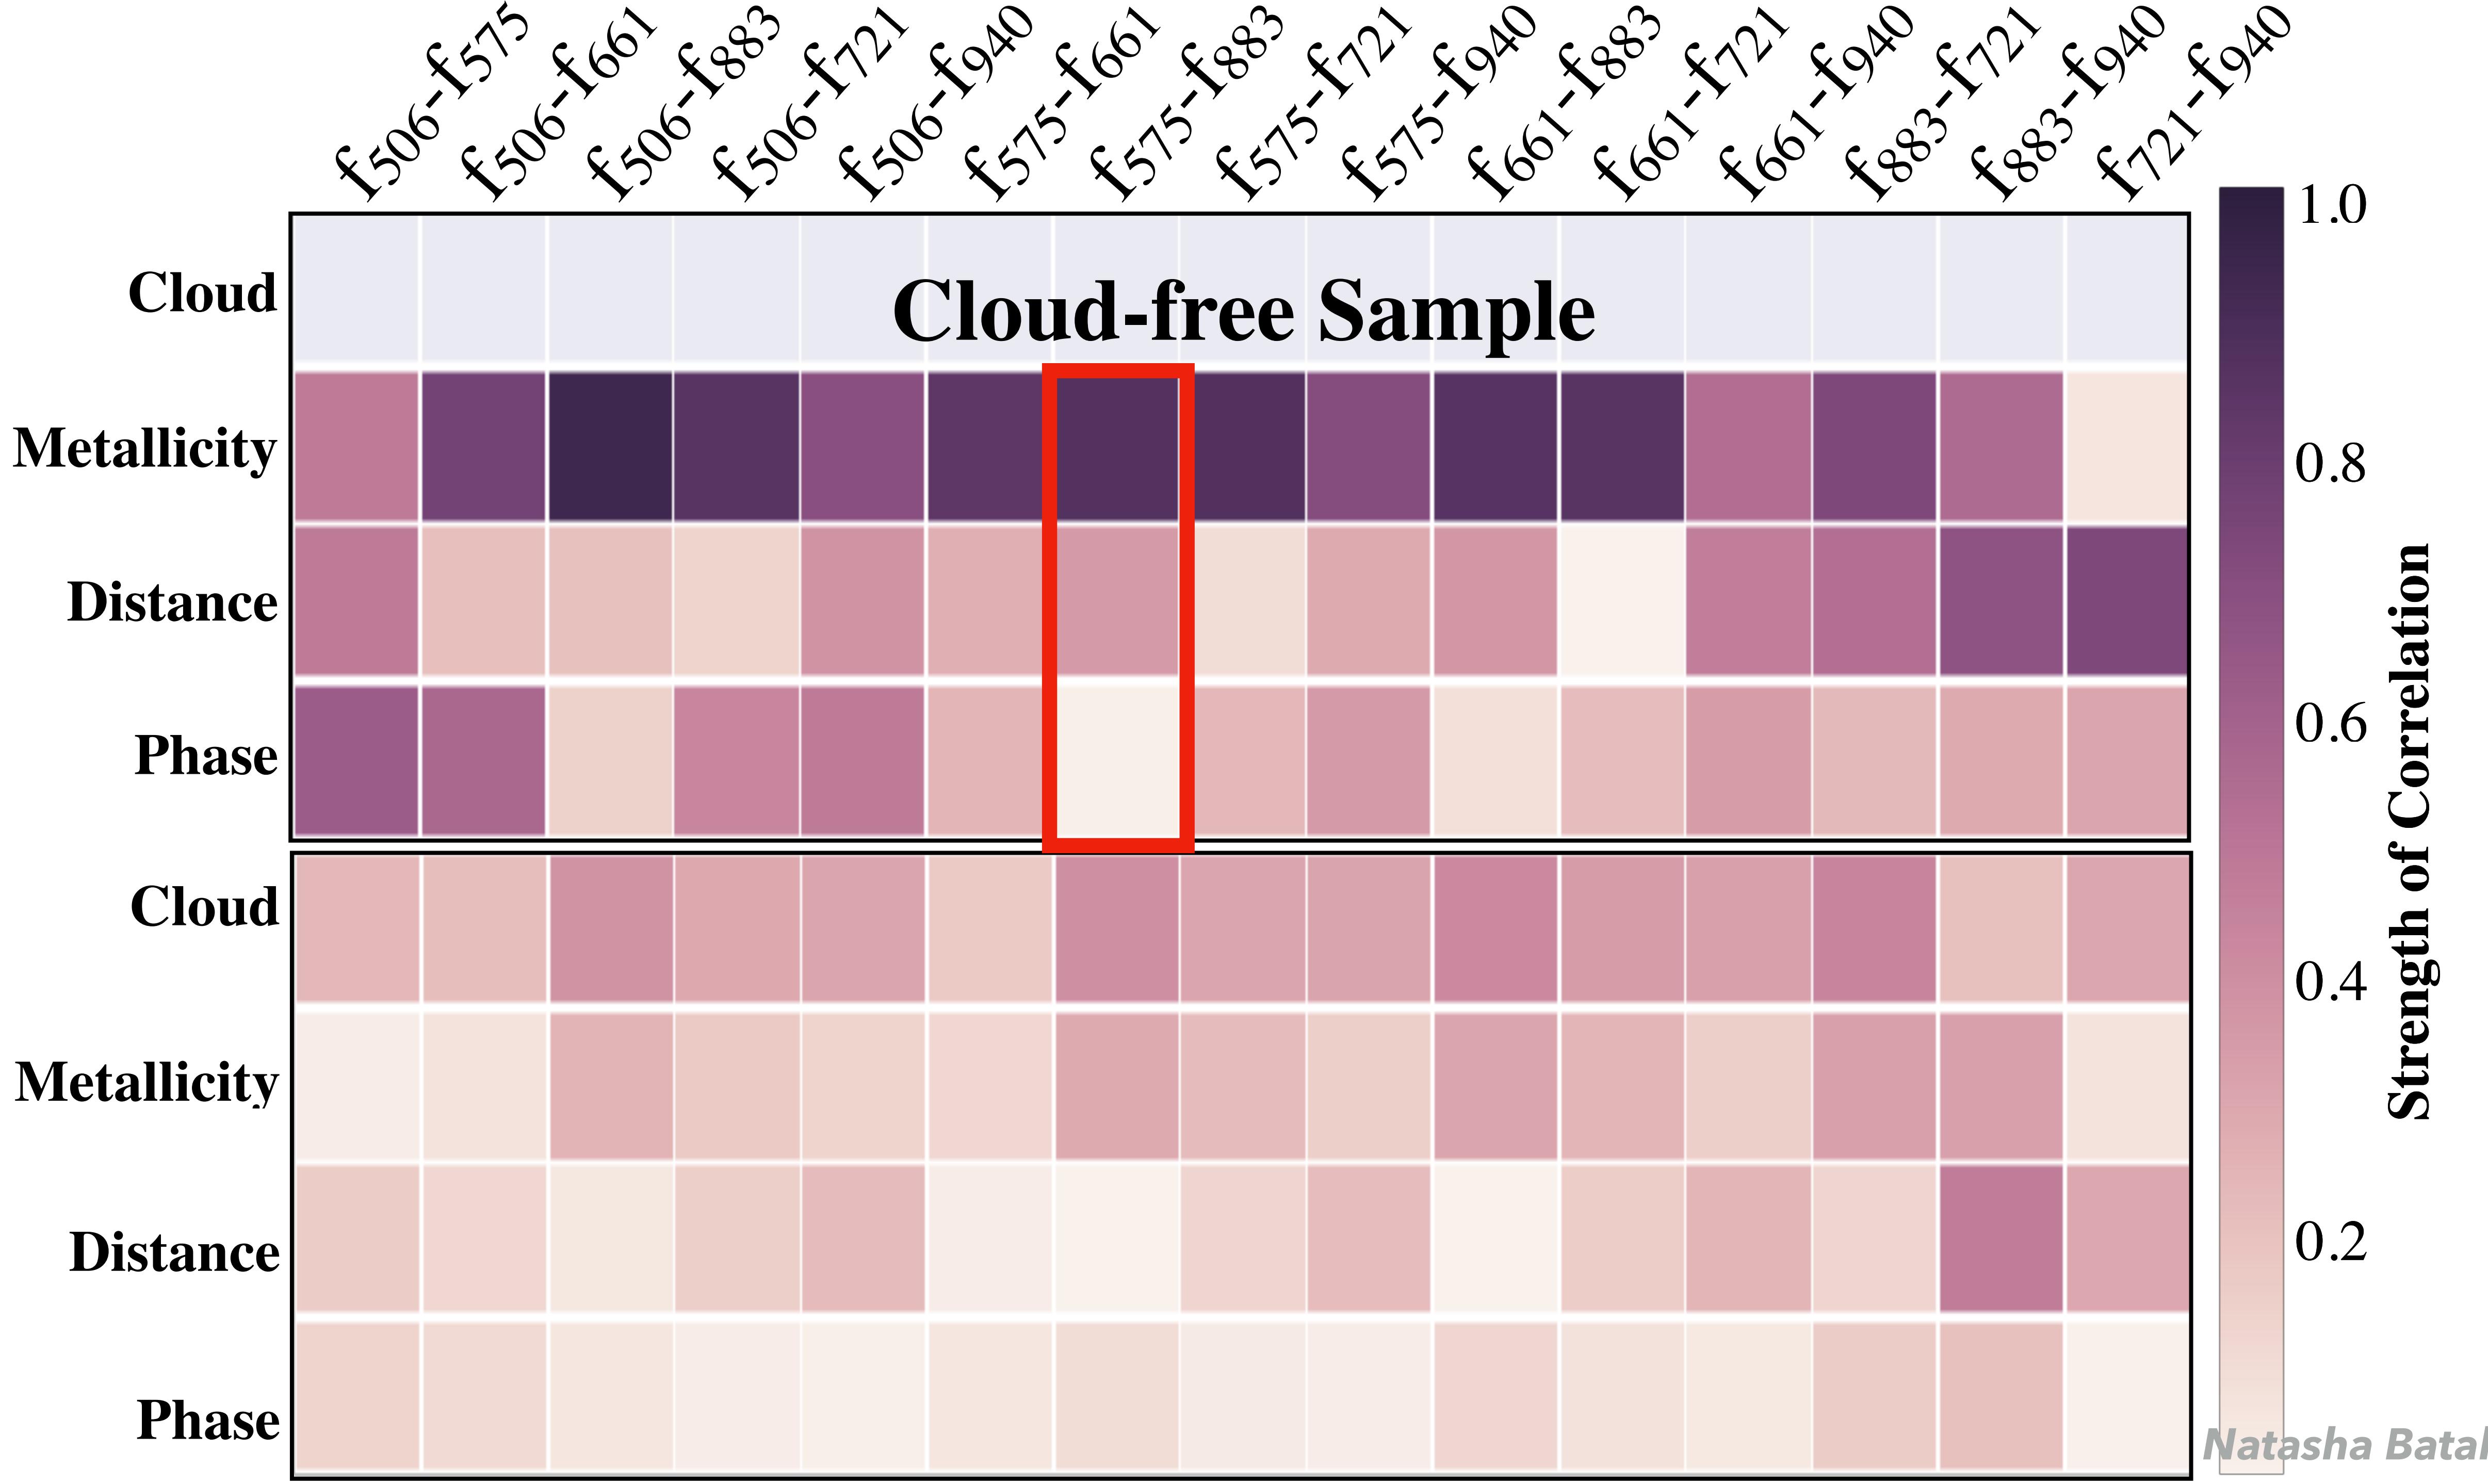

- ▶ Are there any correlations between physical planet properties and WFIRST-like photometric filters
- ▶ If so, can we leverage those to create color-color plot that separate planets into physically motivated groups
- ▶ If not color-color plot, can lots of statistics do the trick?

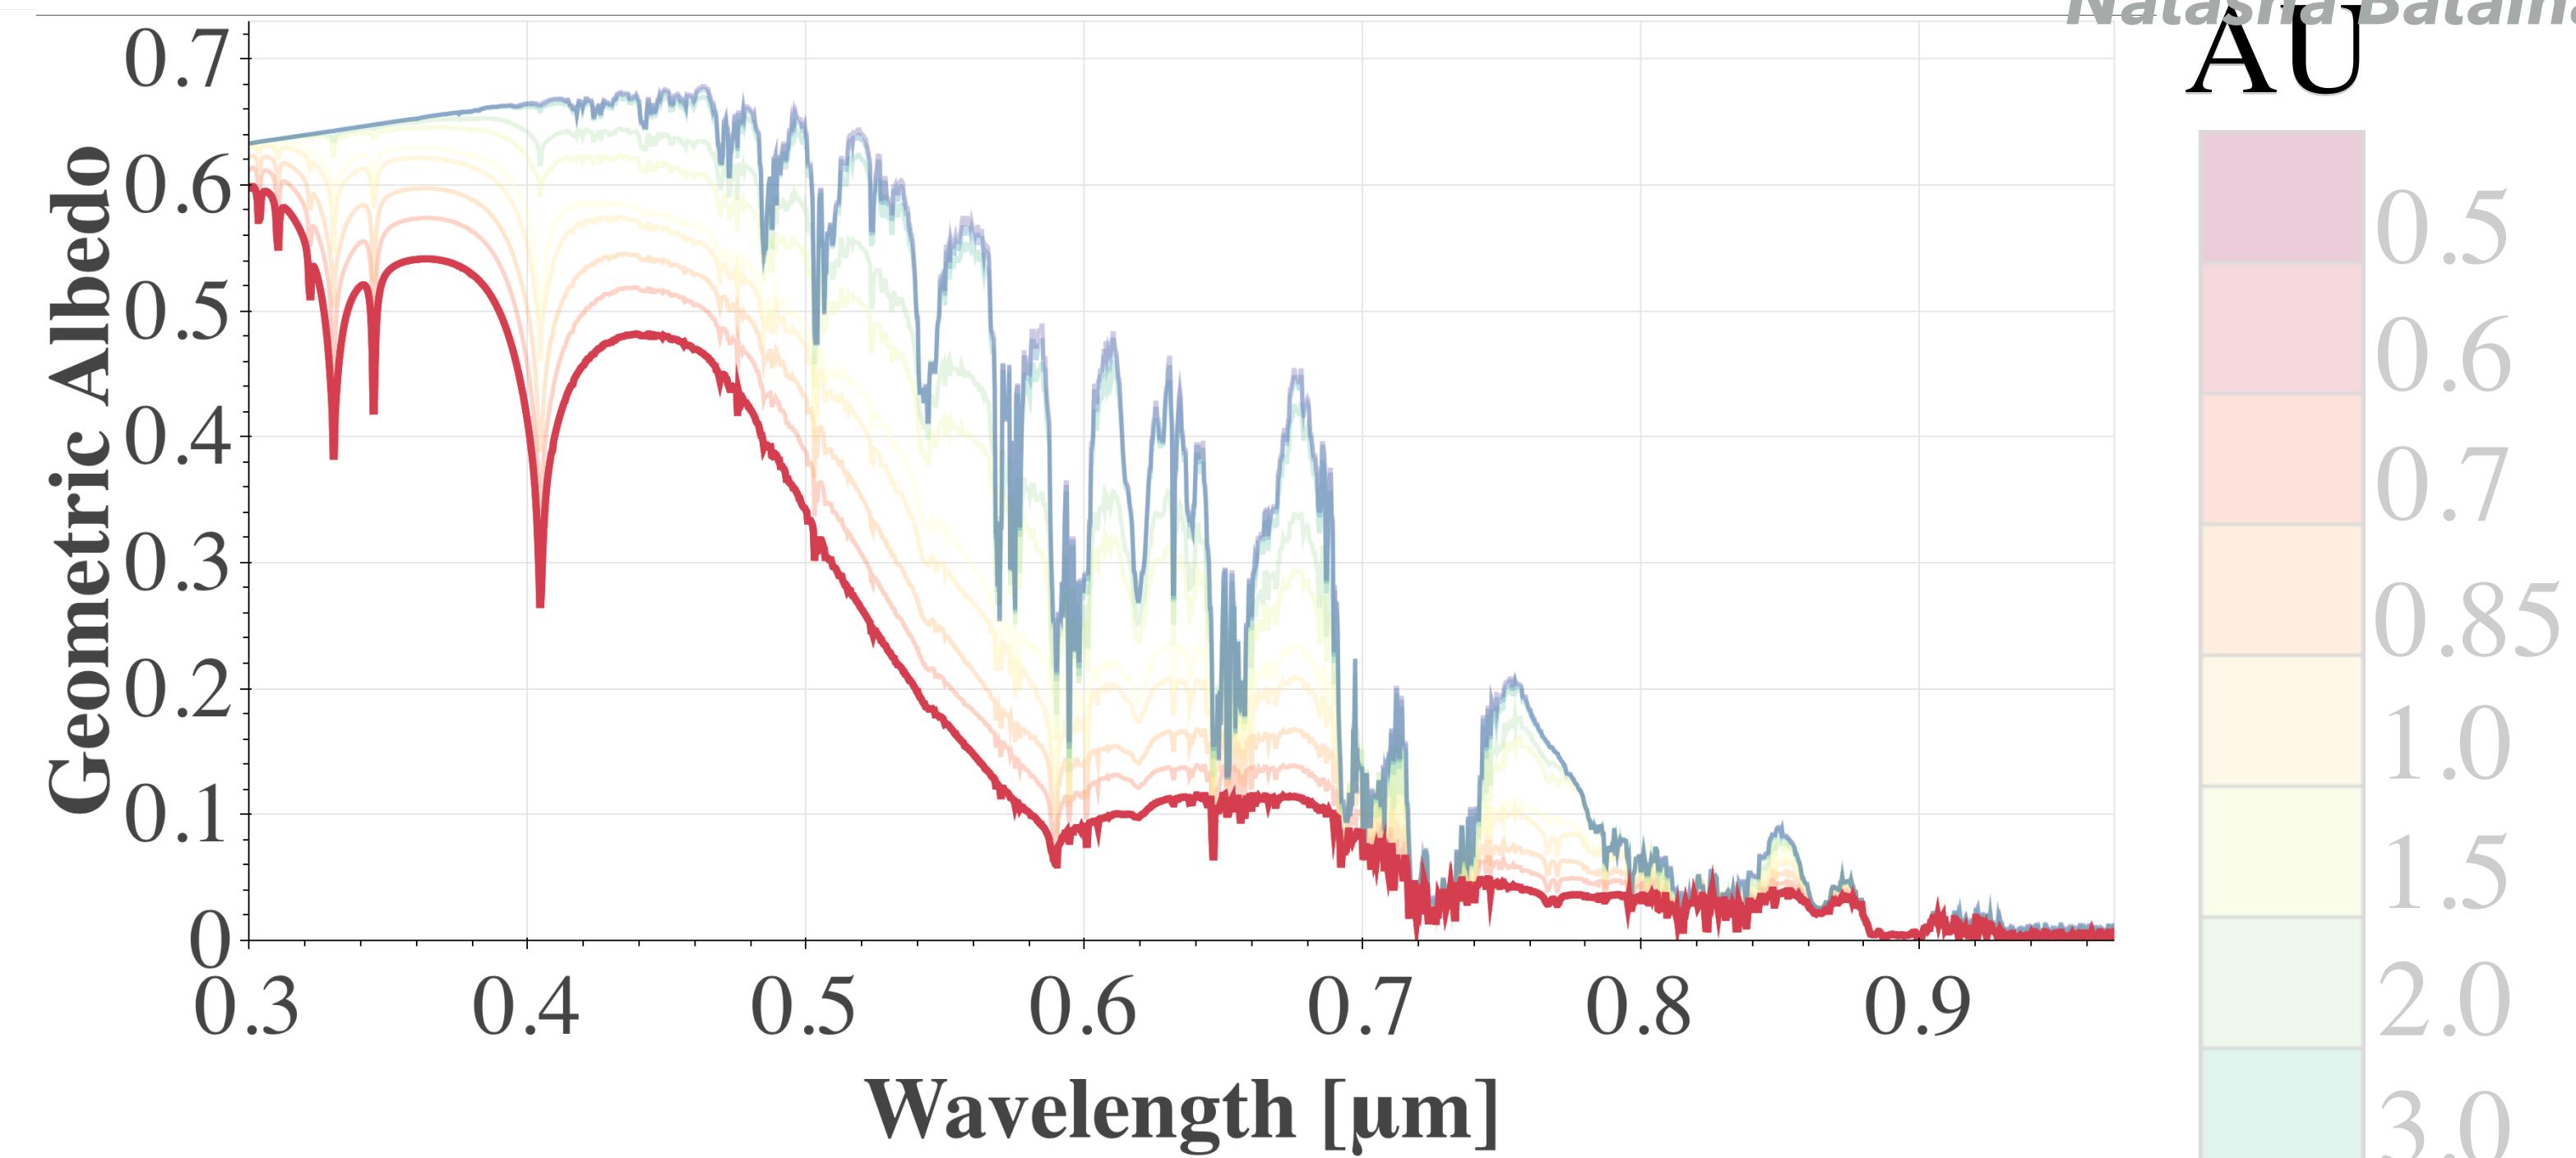

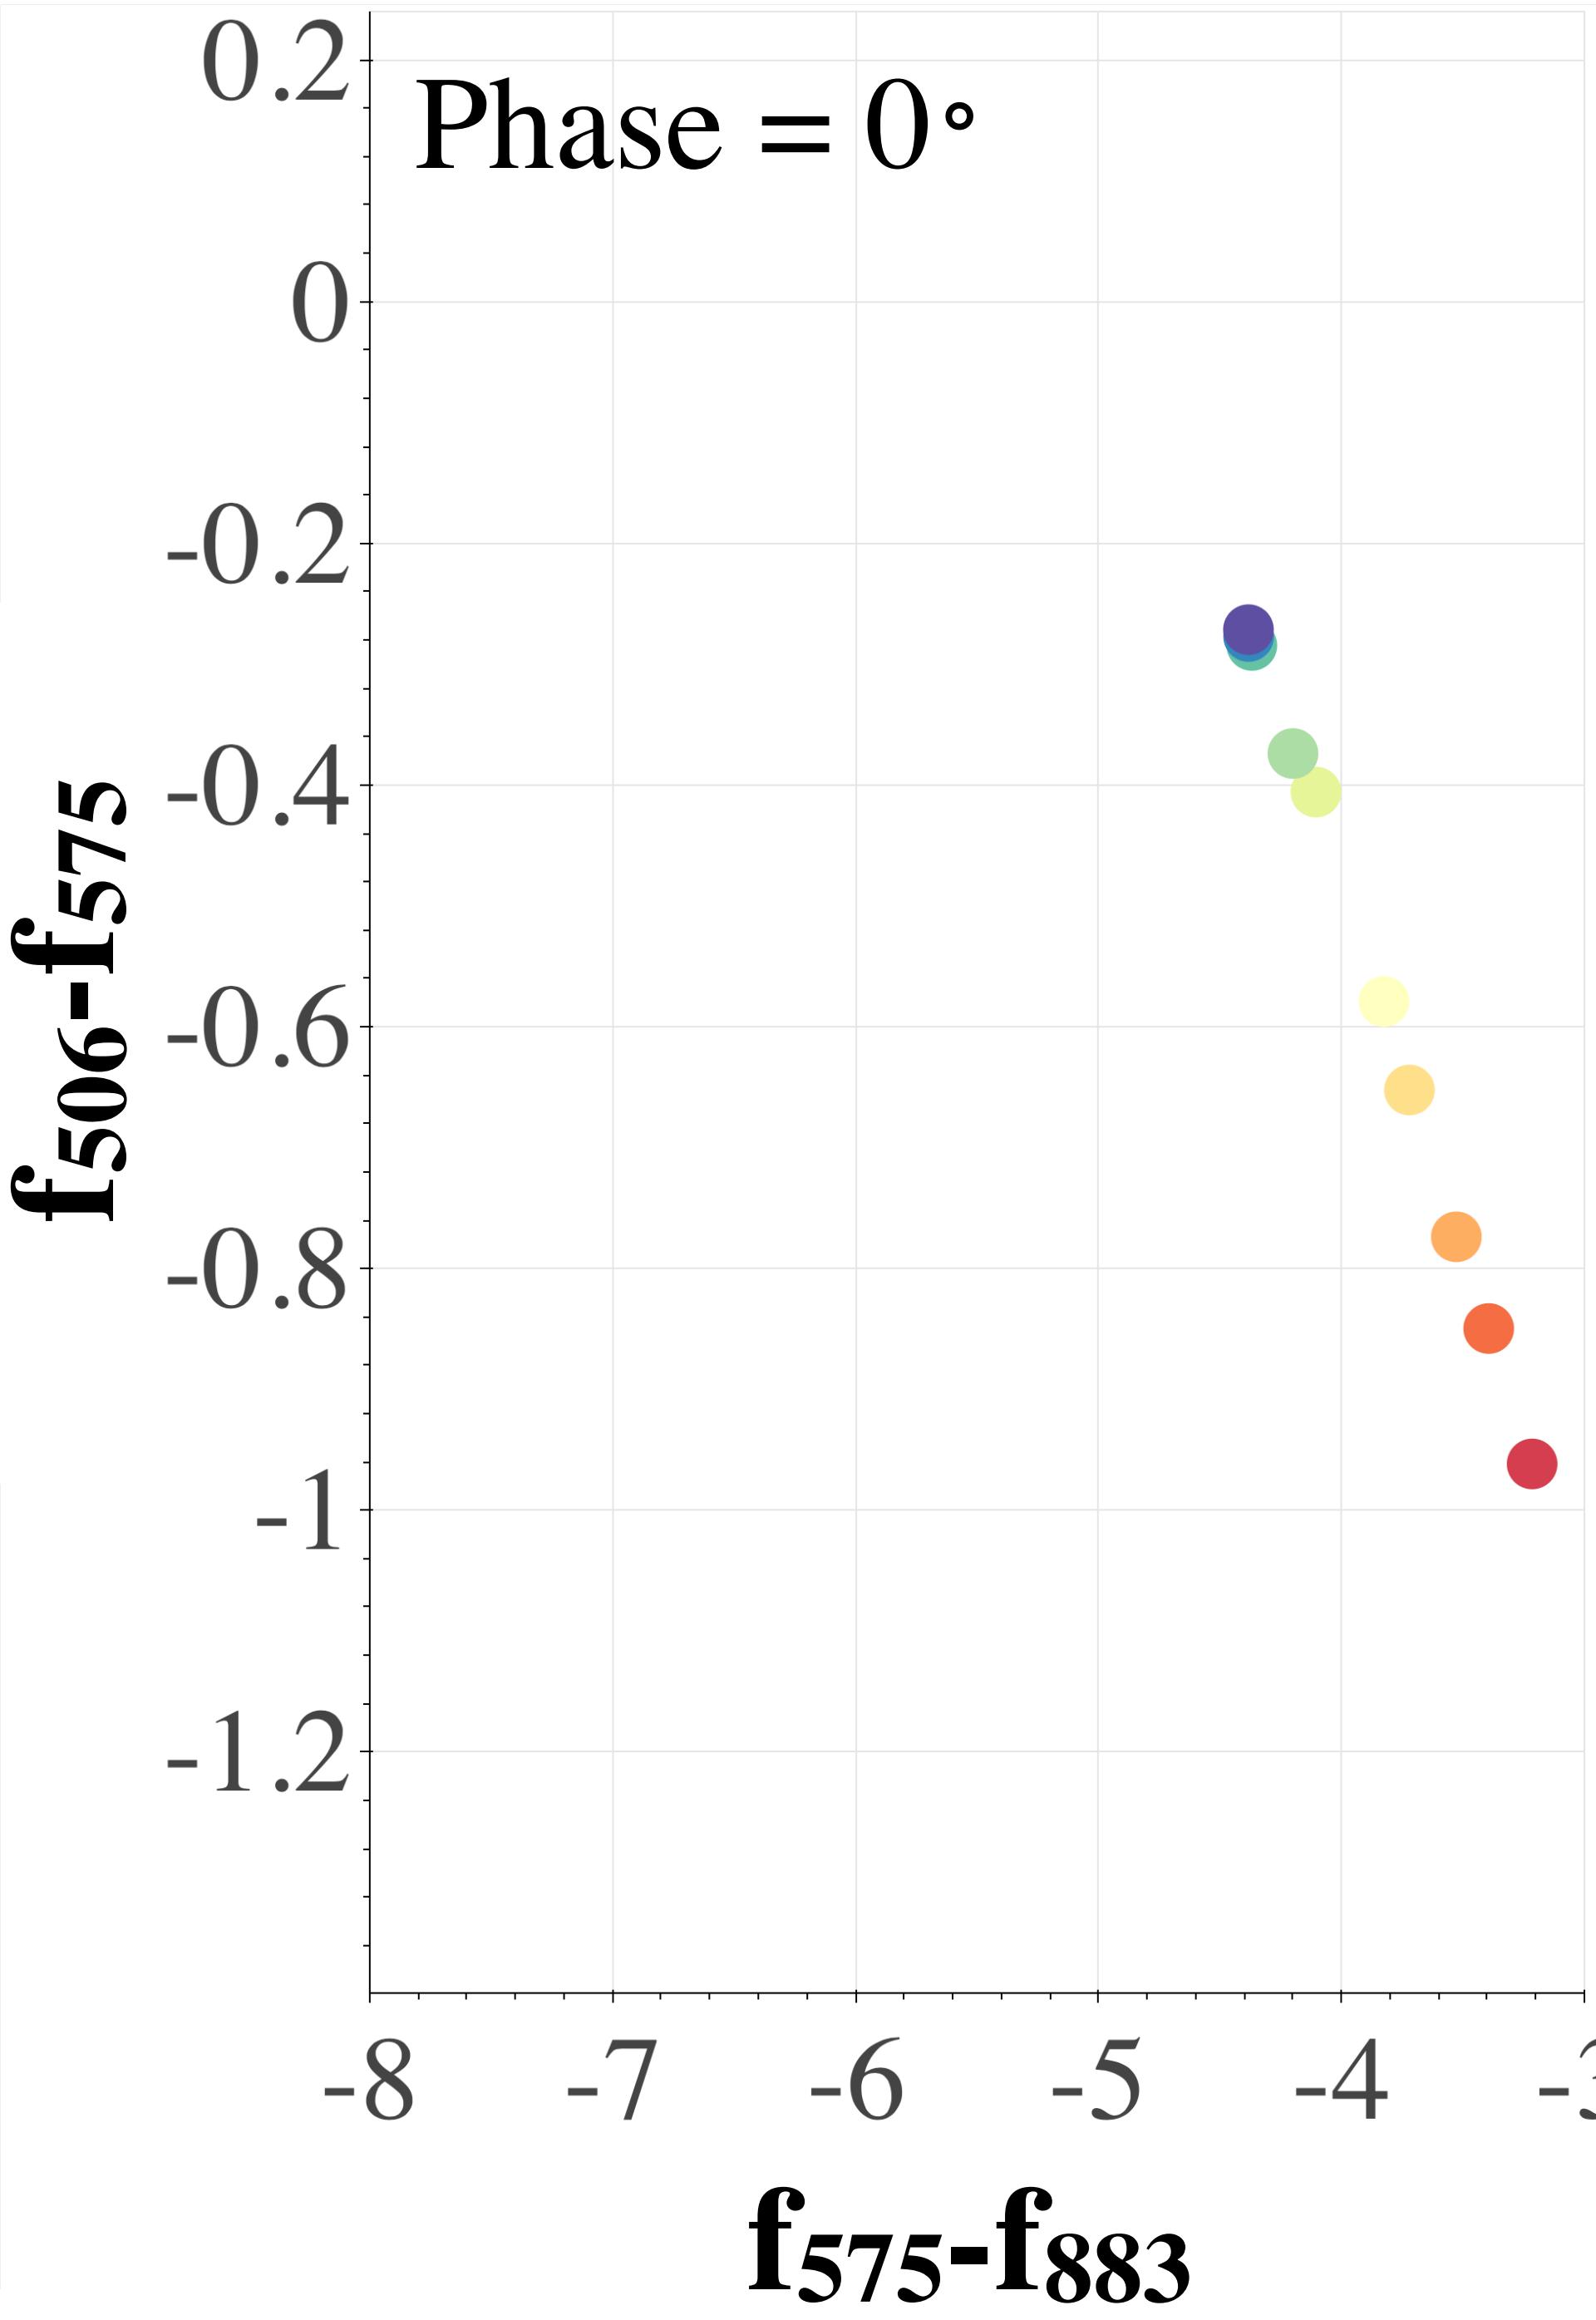

**Semi-major axis  $\times$  M/H  $\times$  clouds  $\times$  phase =  
\*(temperature)**  
**10,000 reflected light spectra**

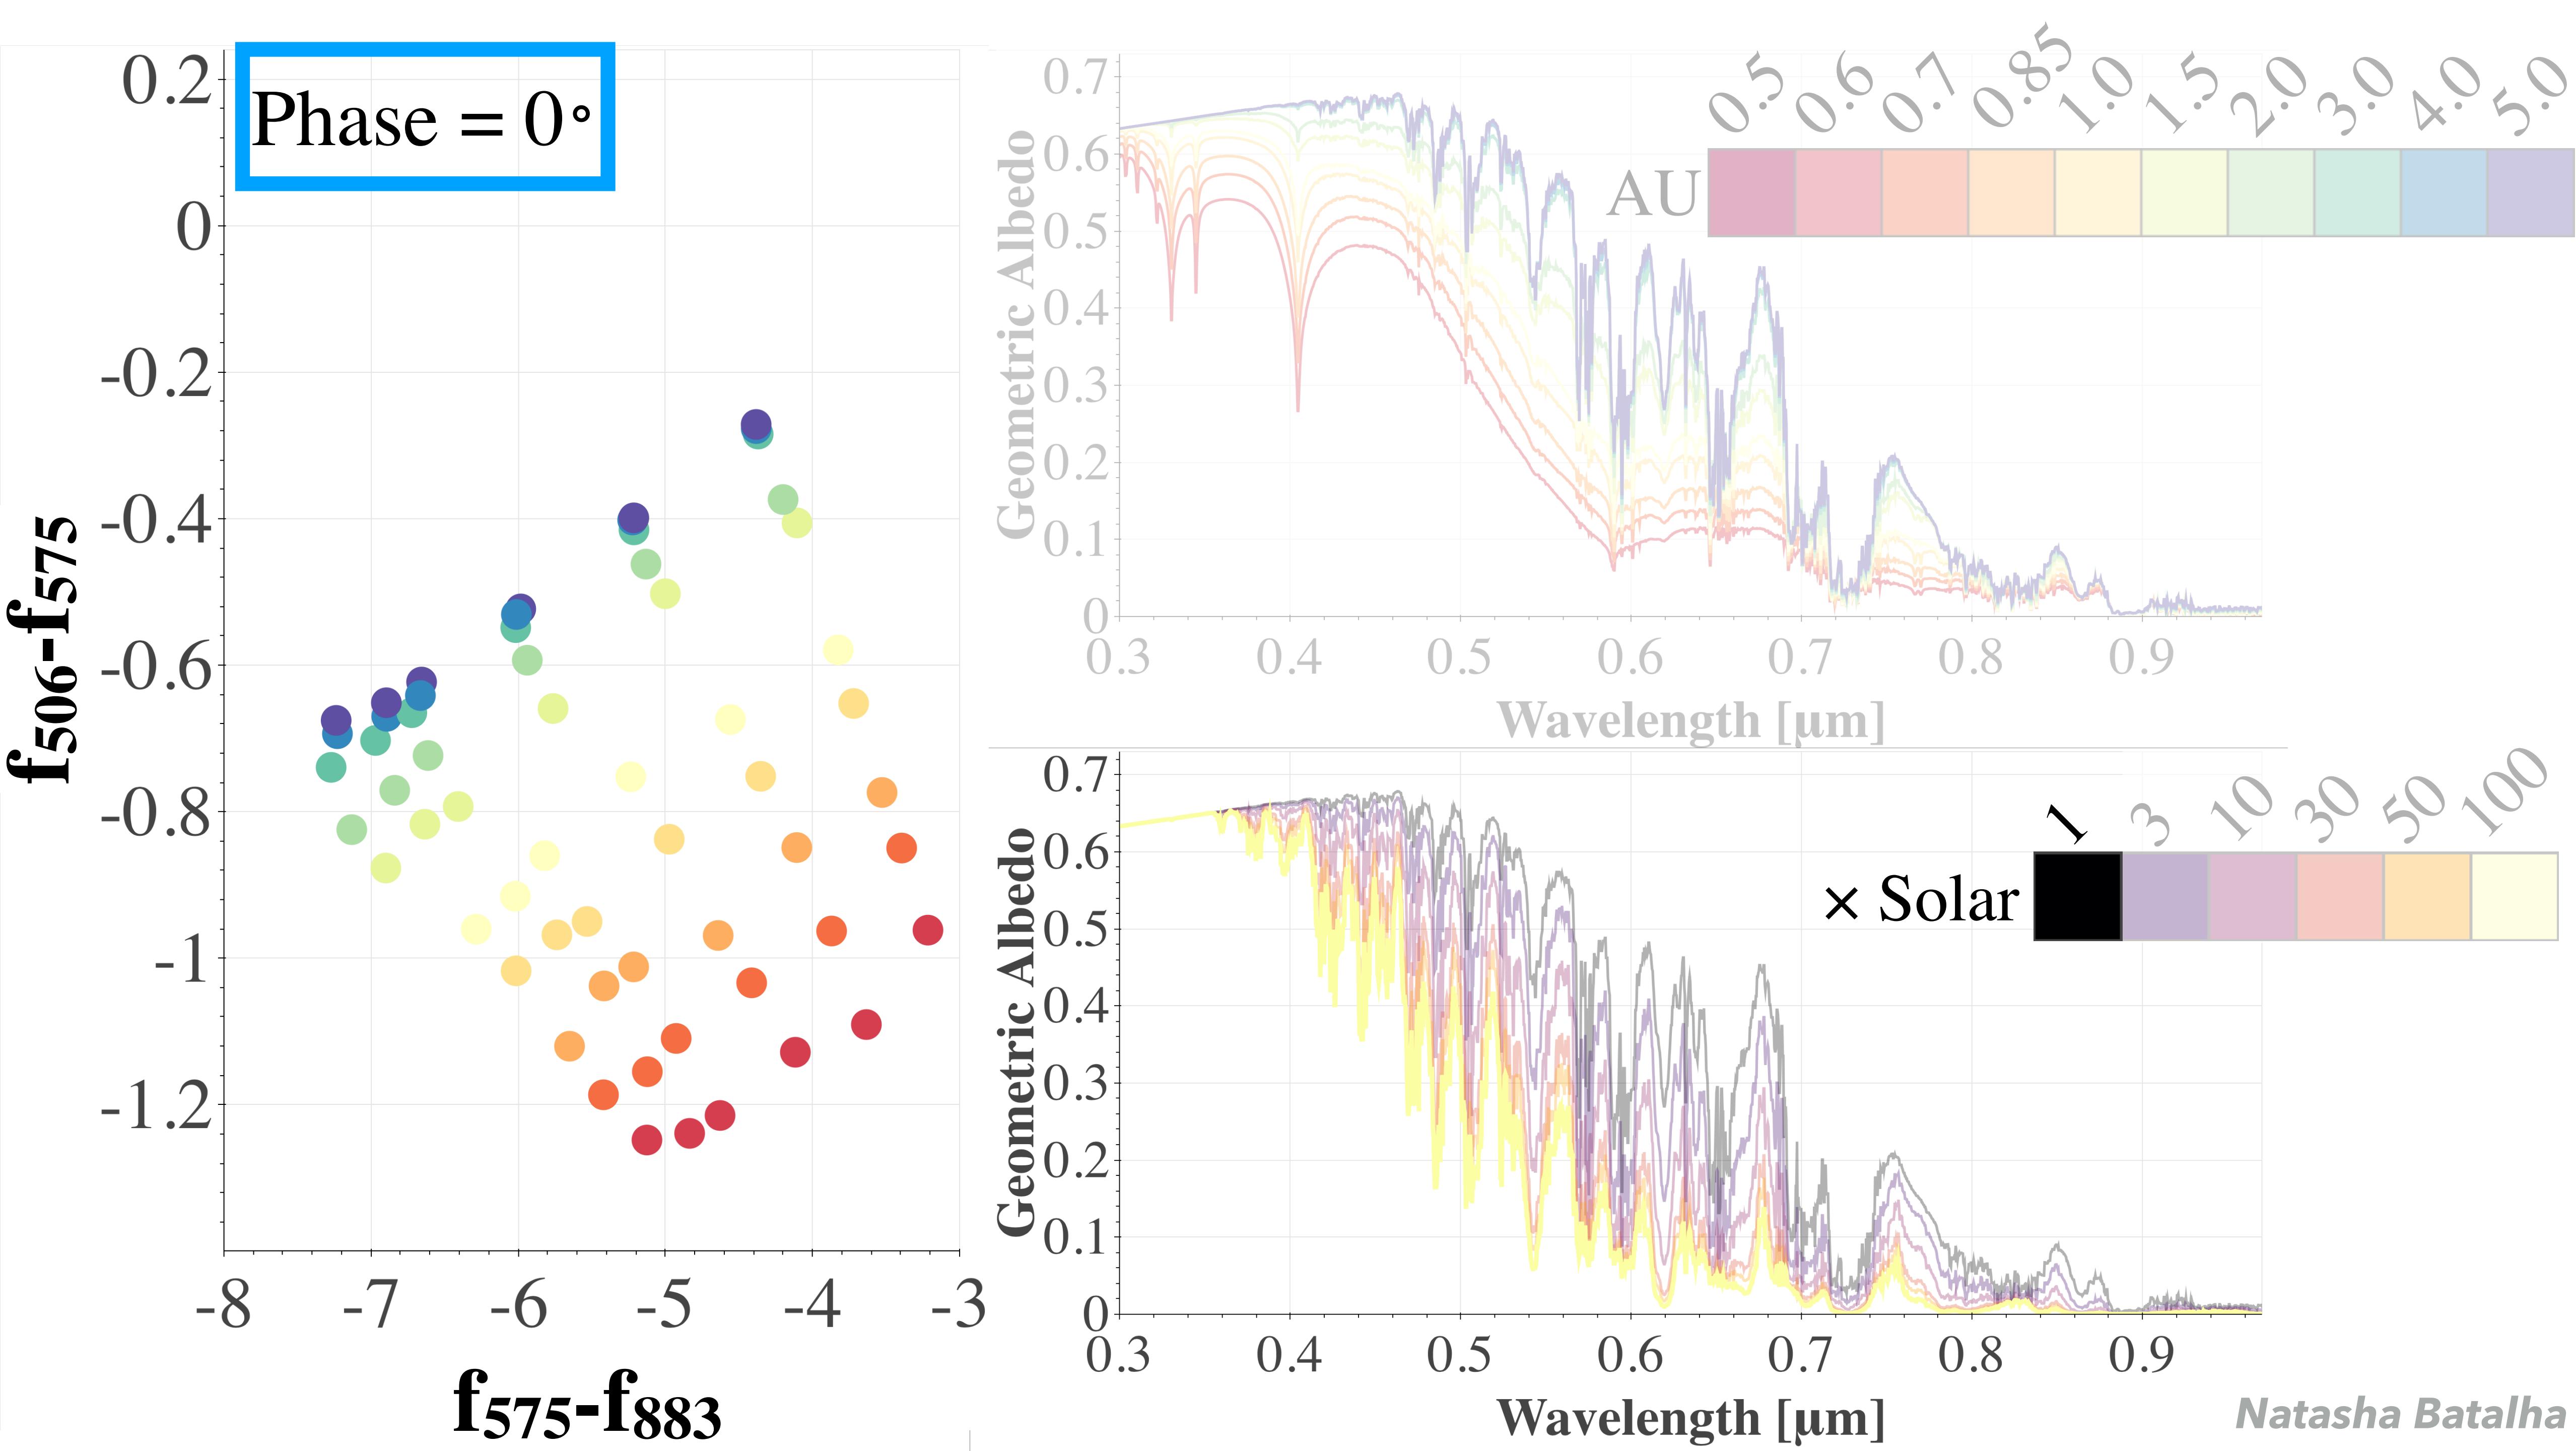

# Approximate Wavelength ( $\mu\text{m}$ )

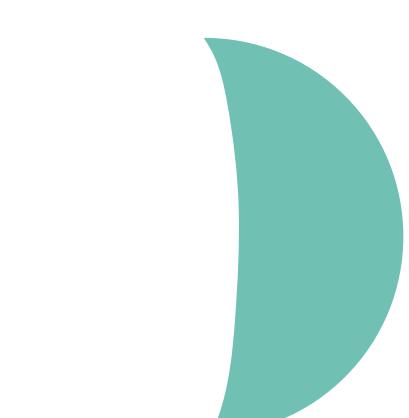

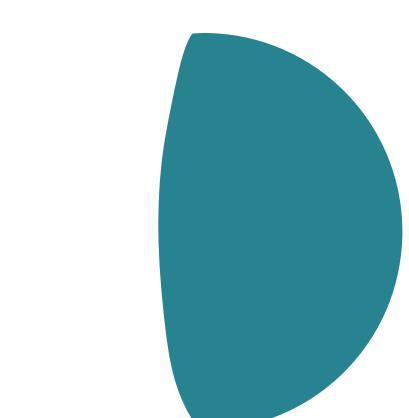

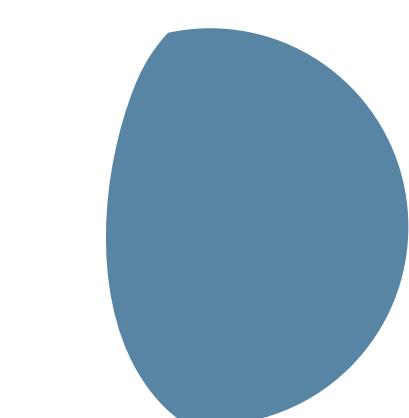

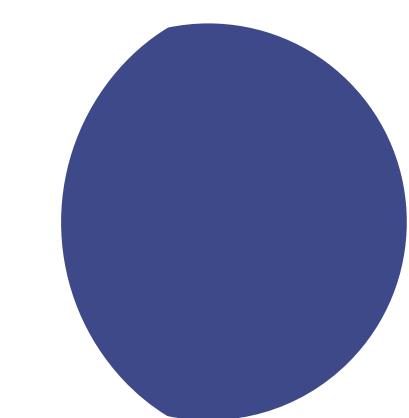

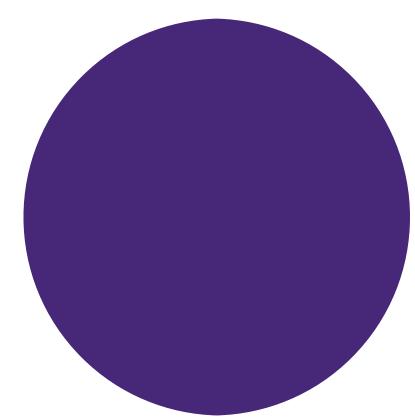

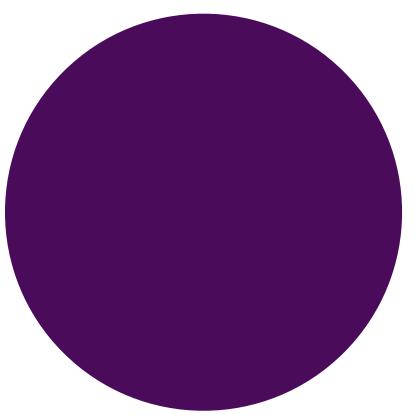

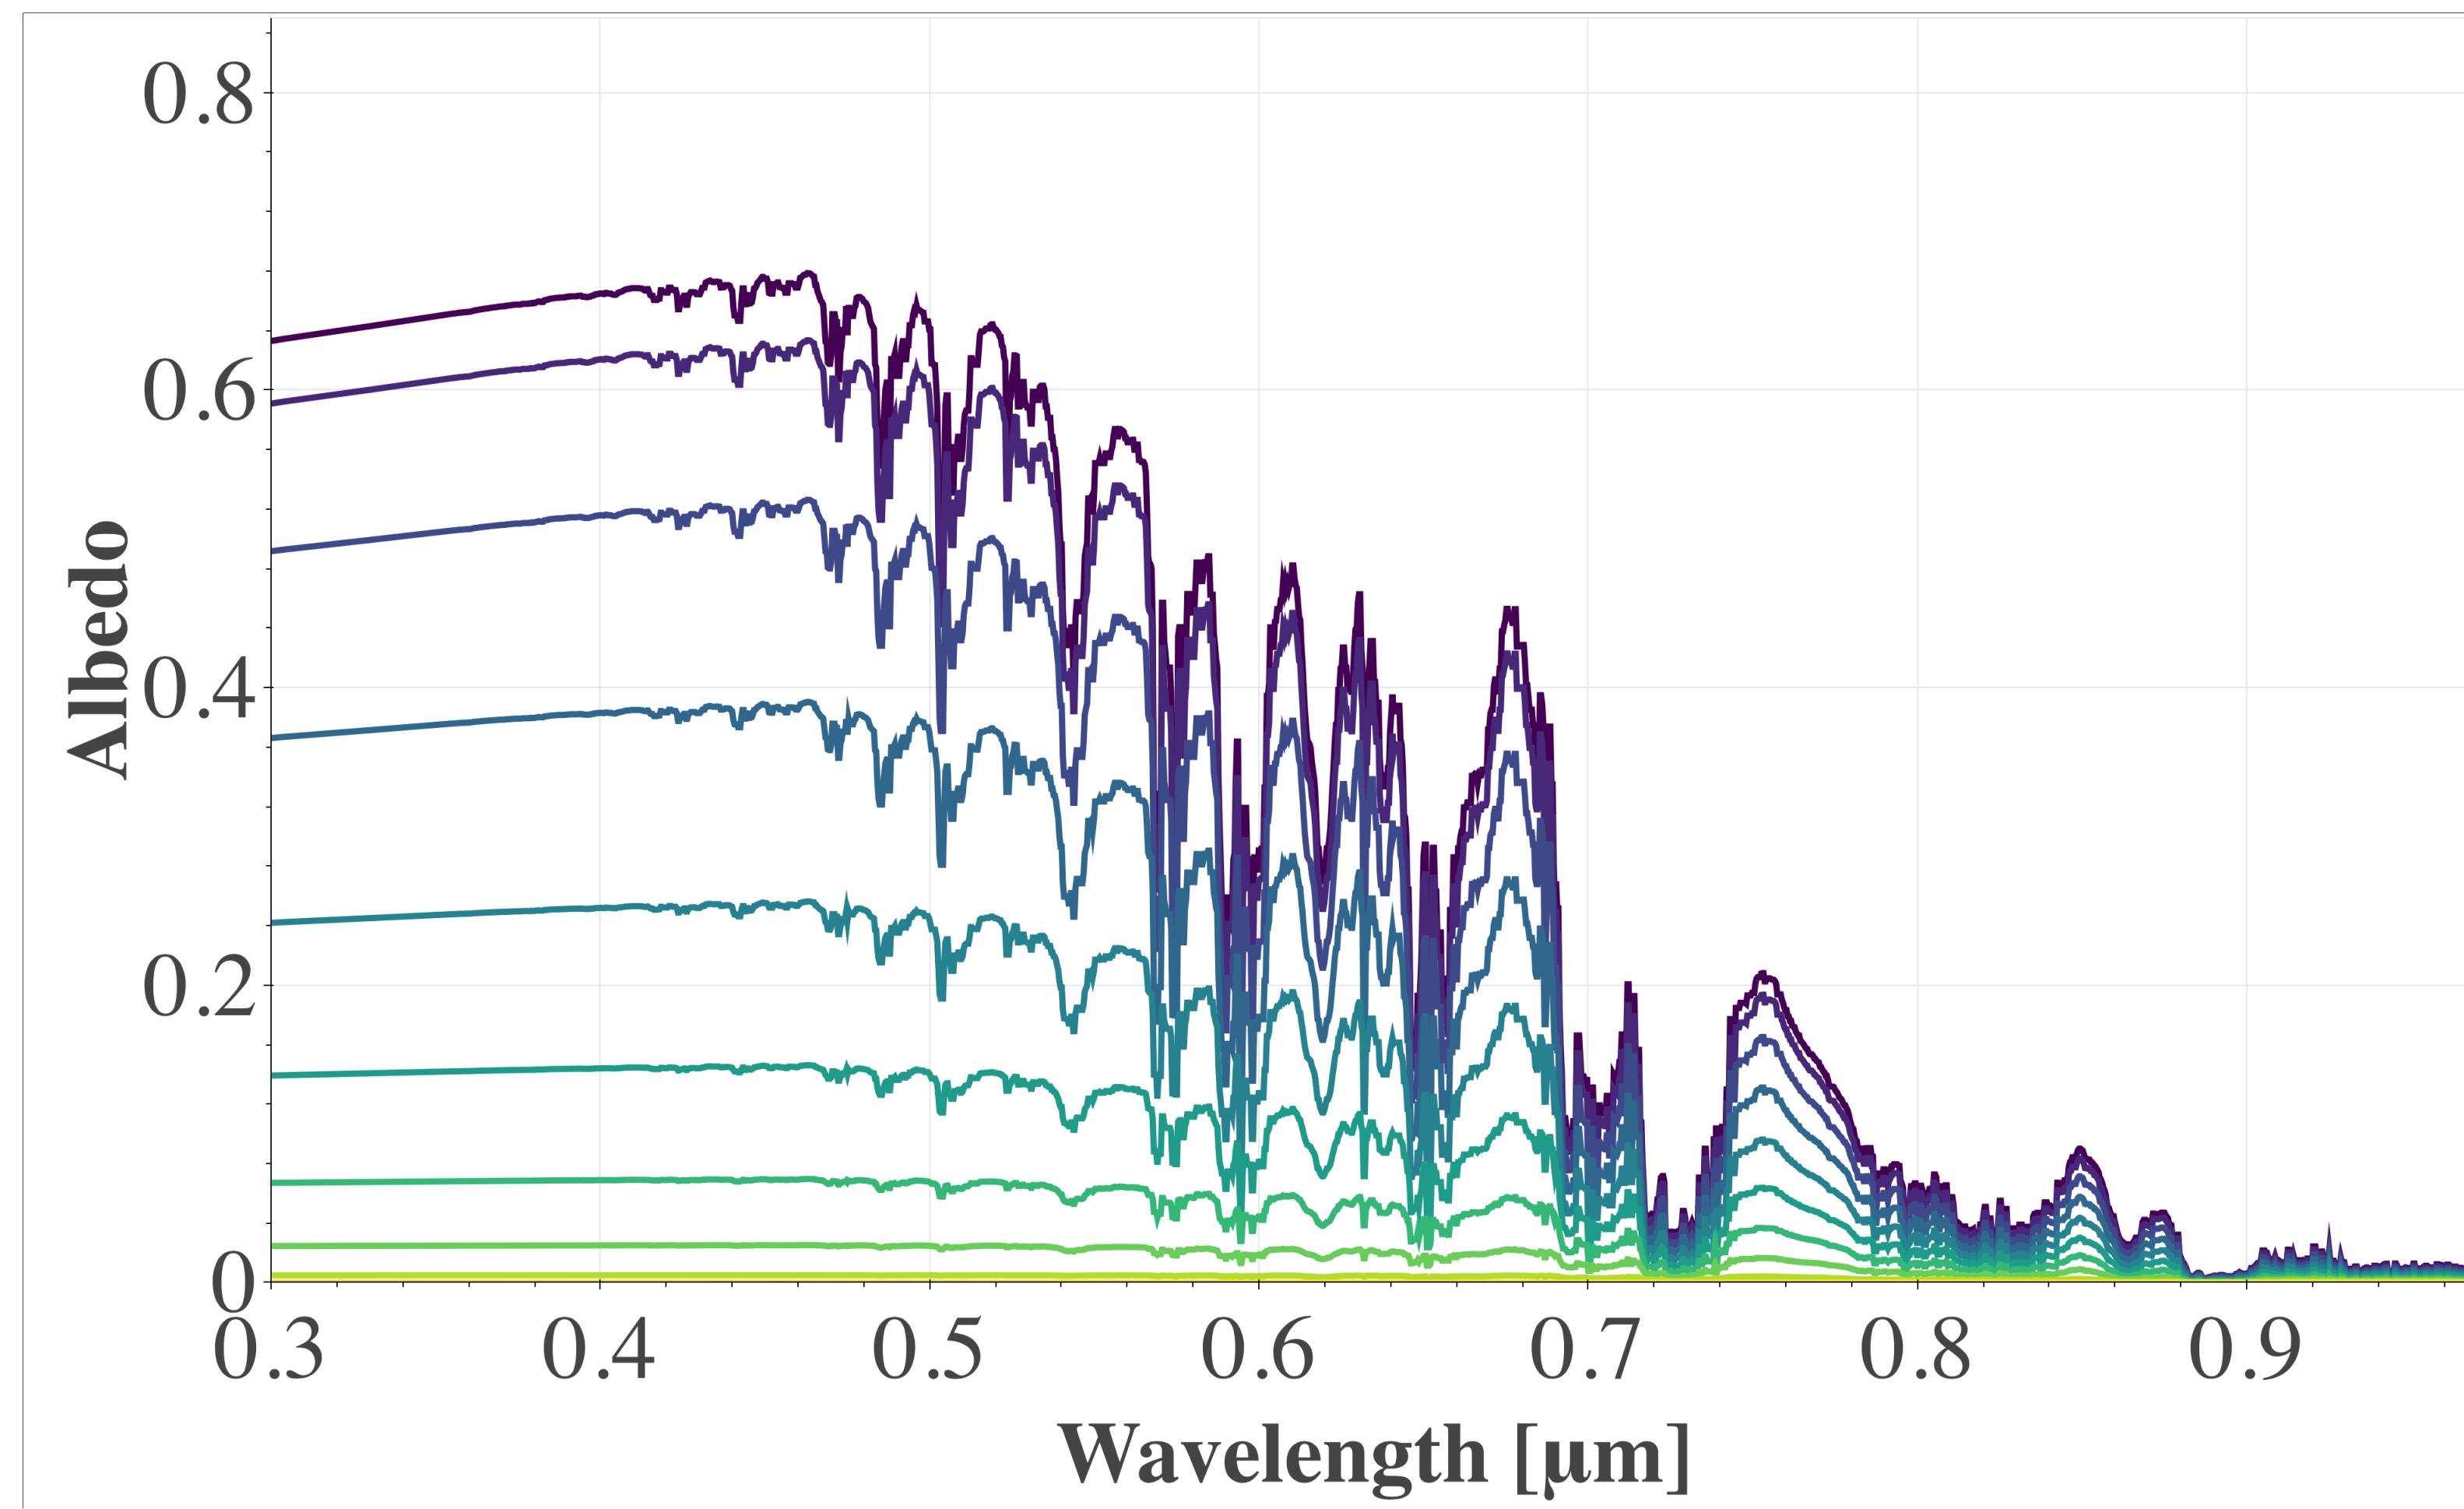

AU

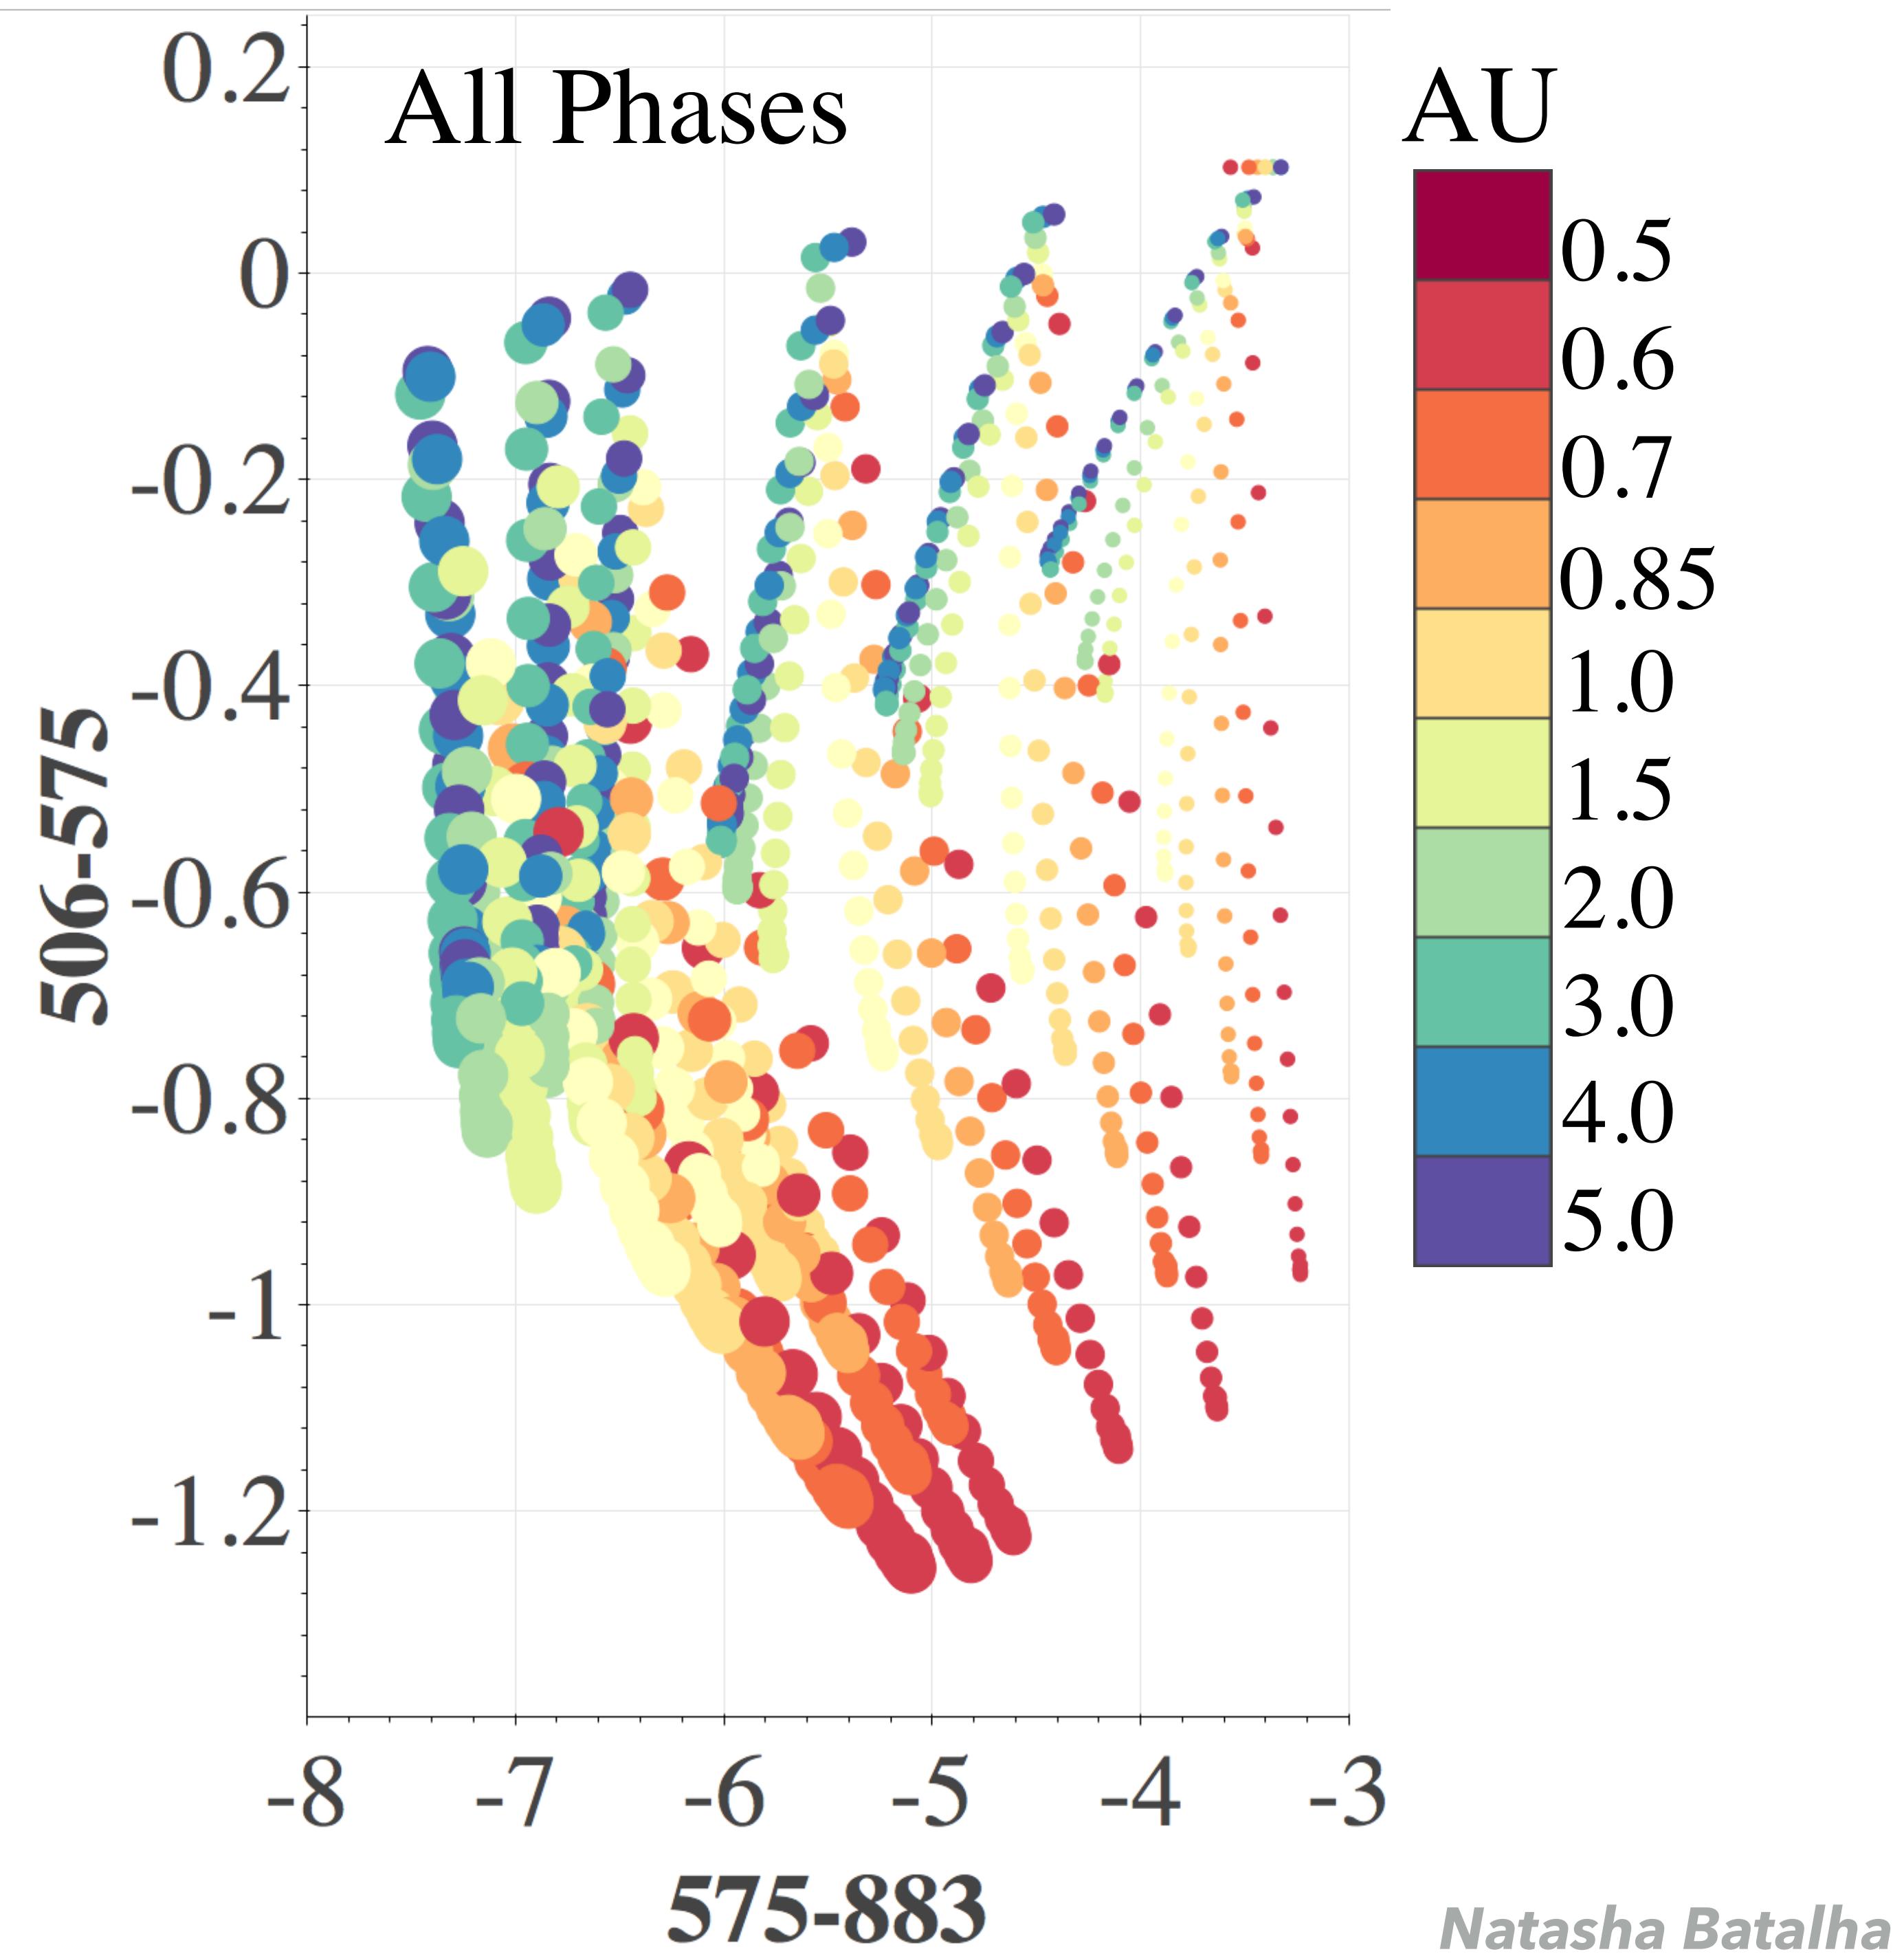

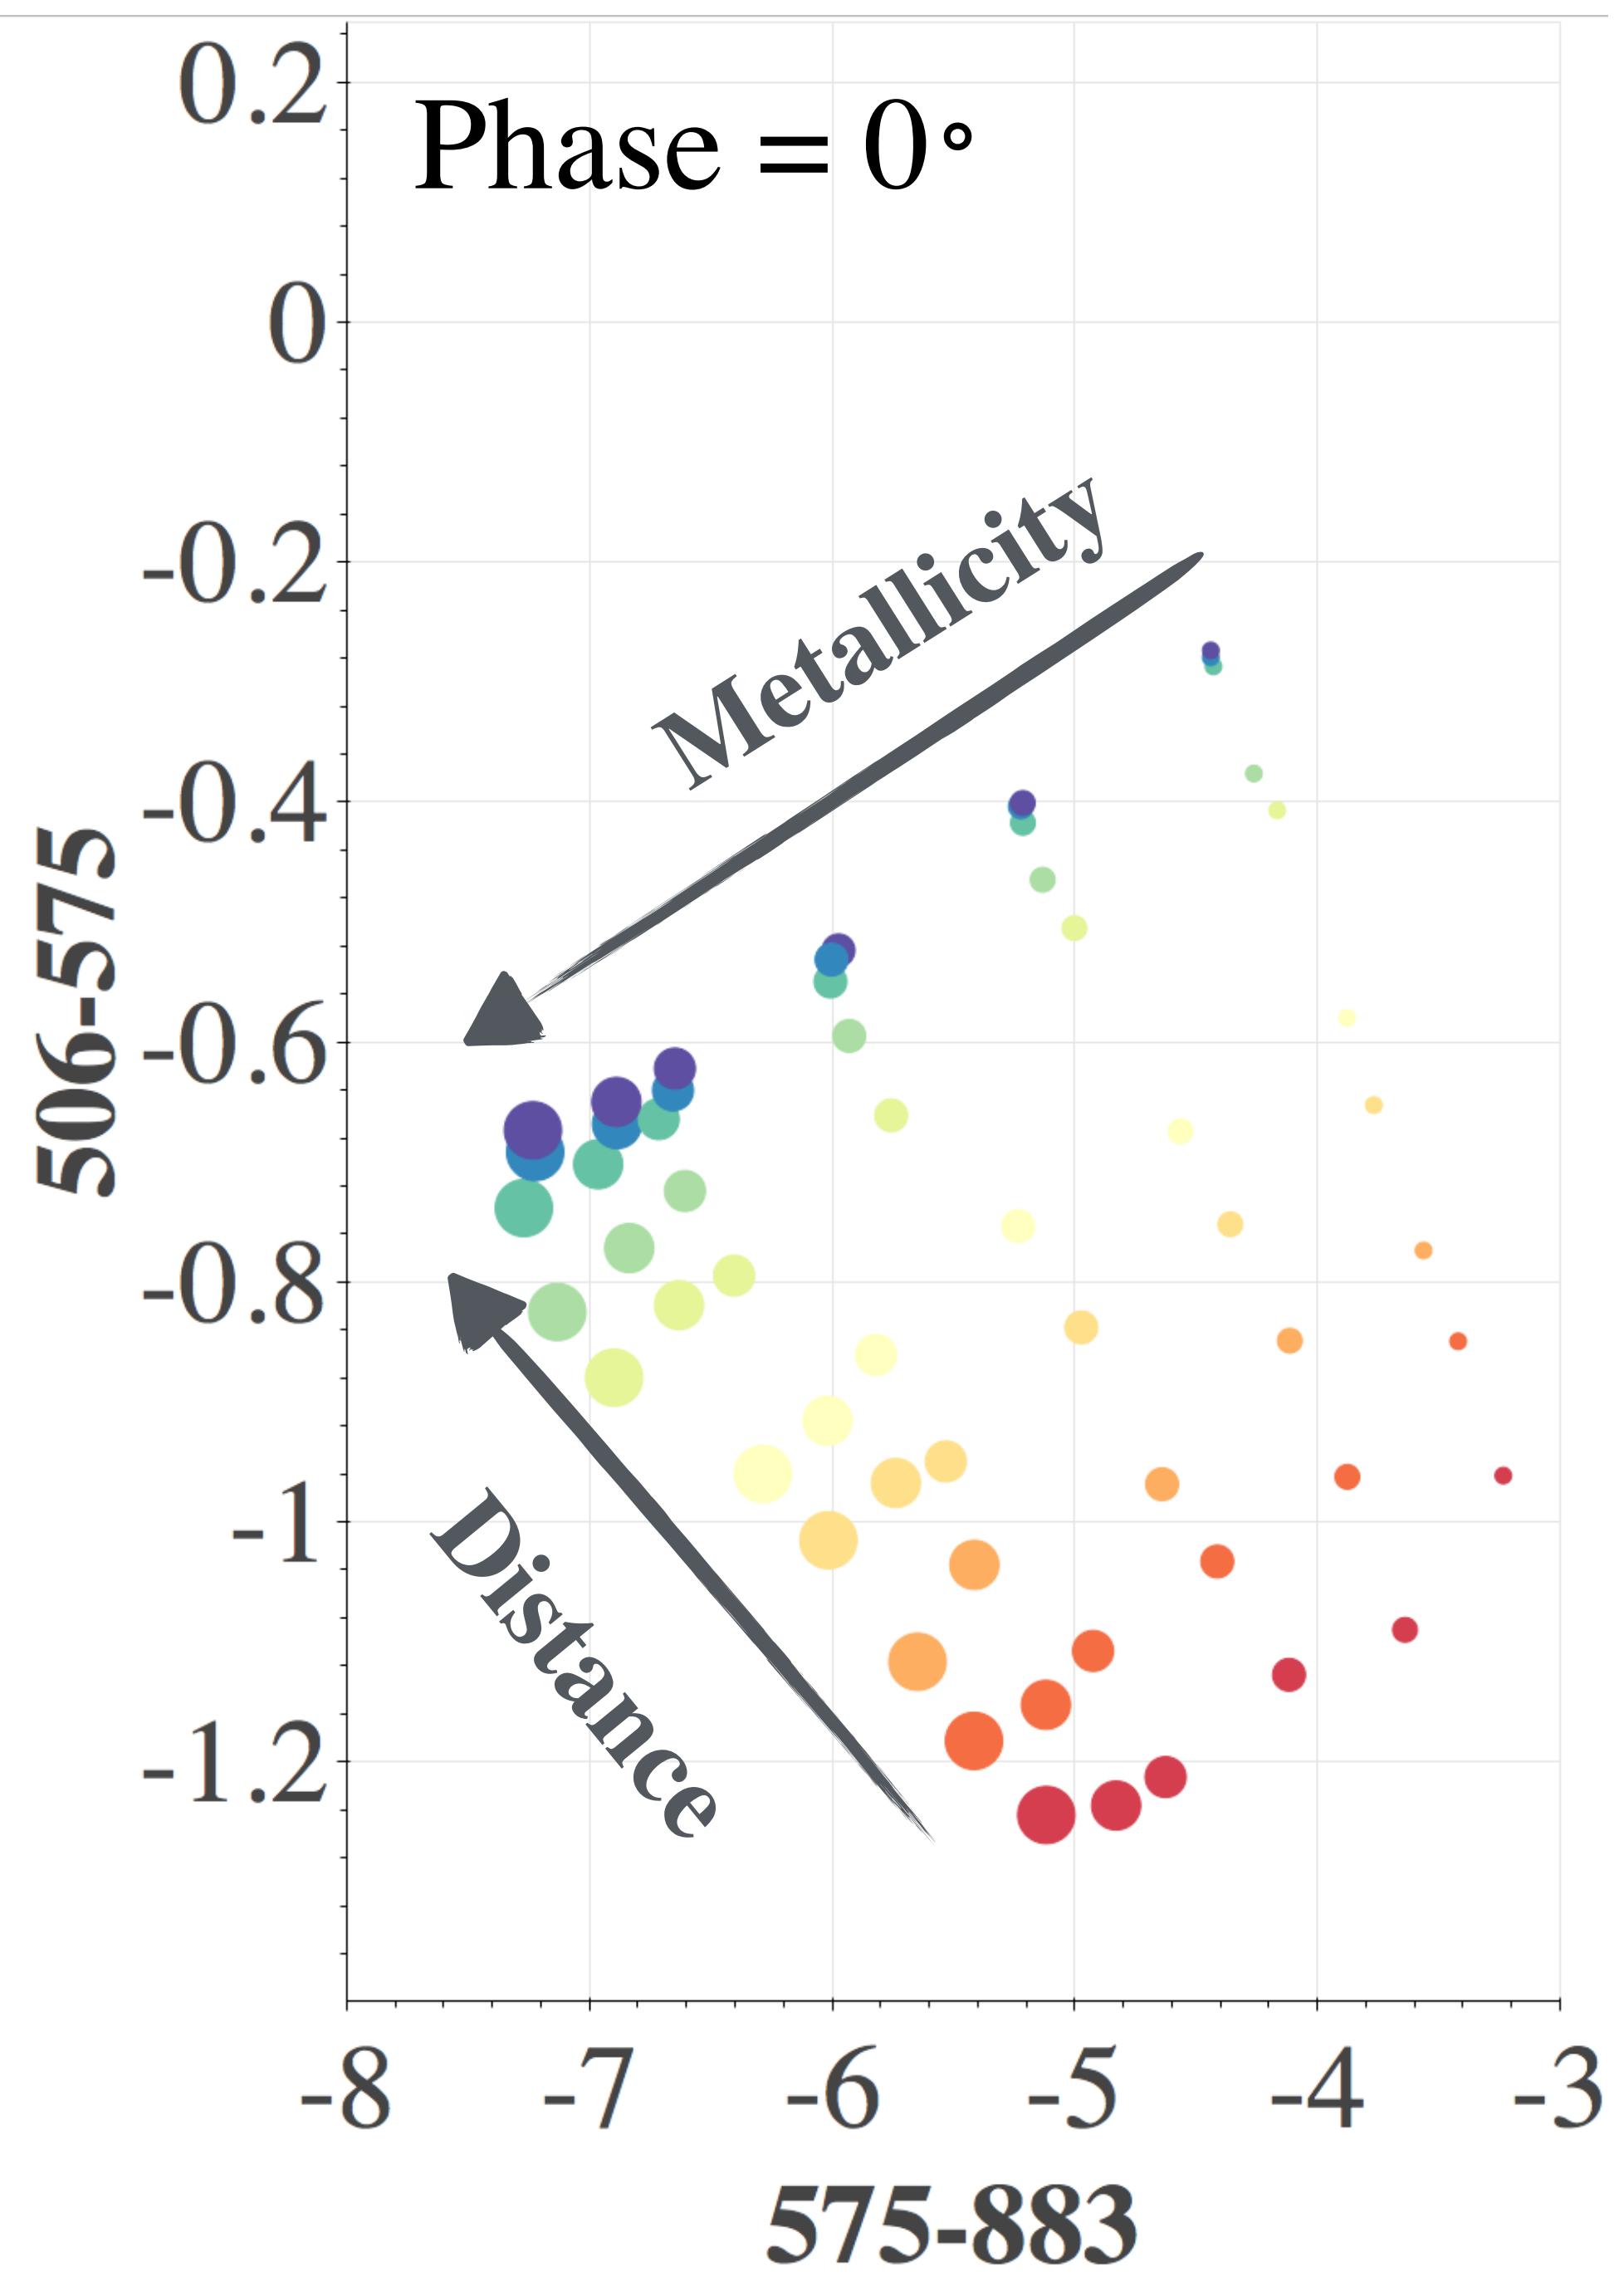

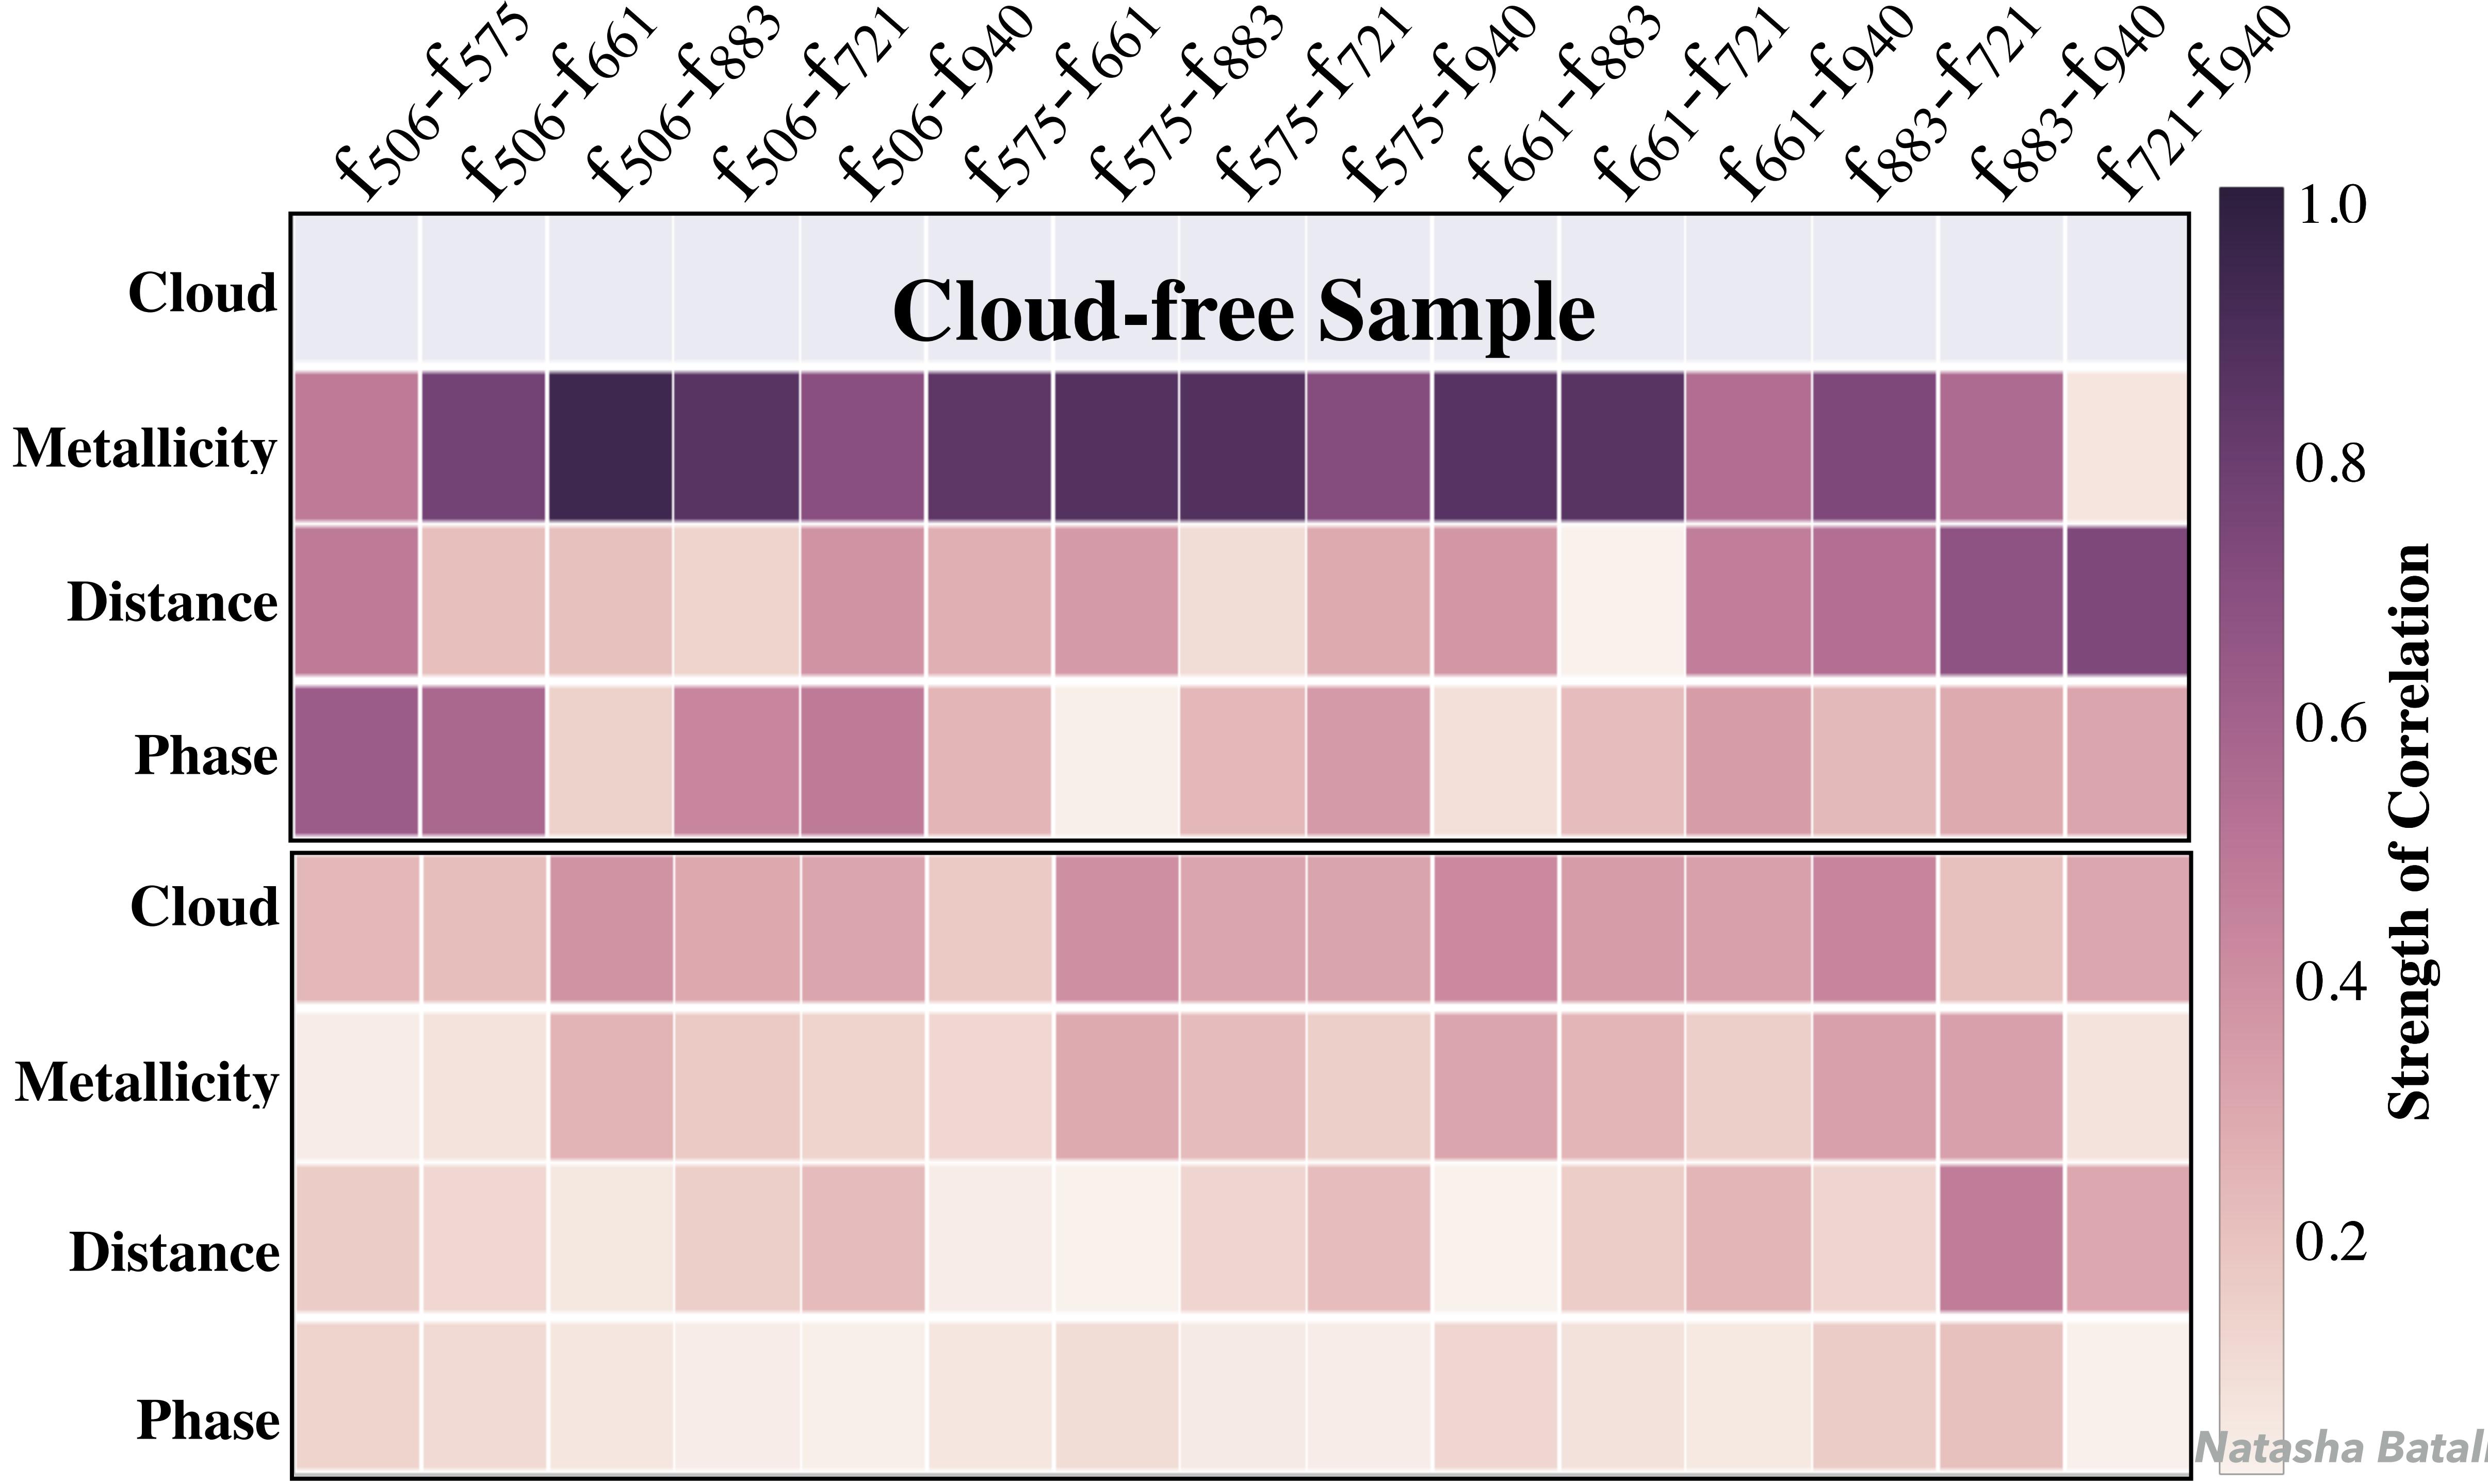

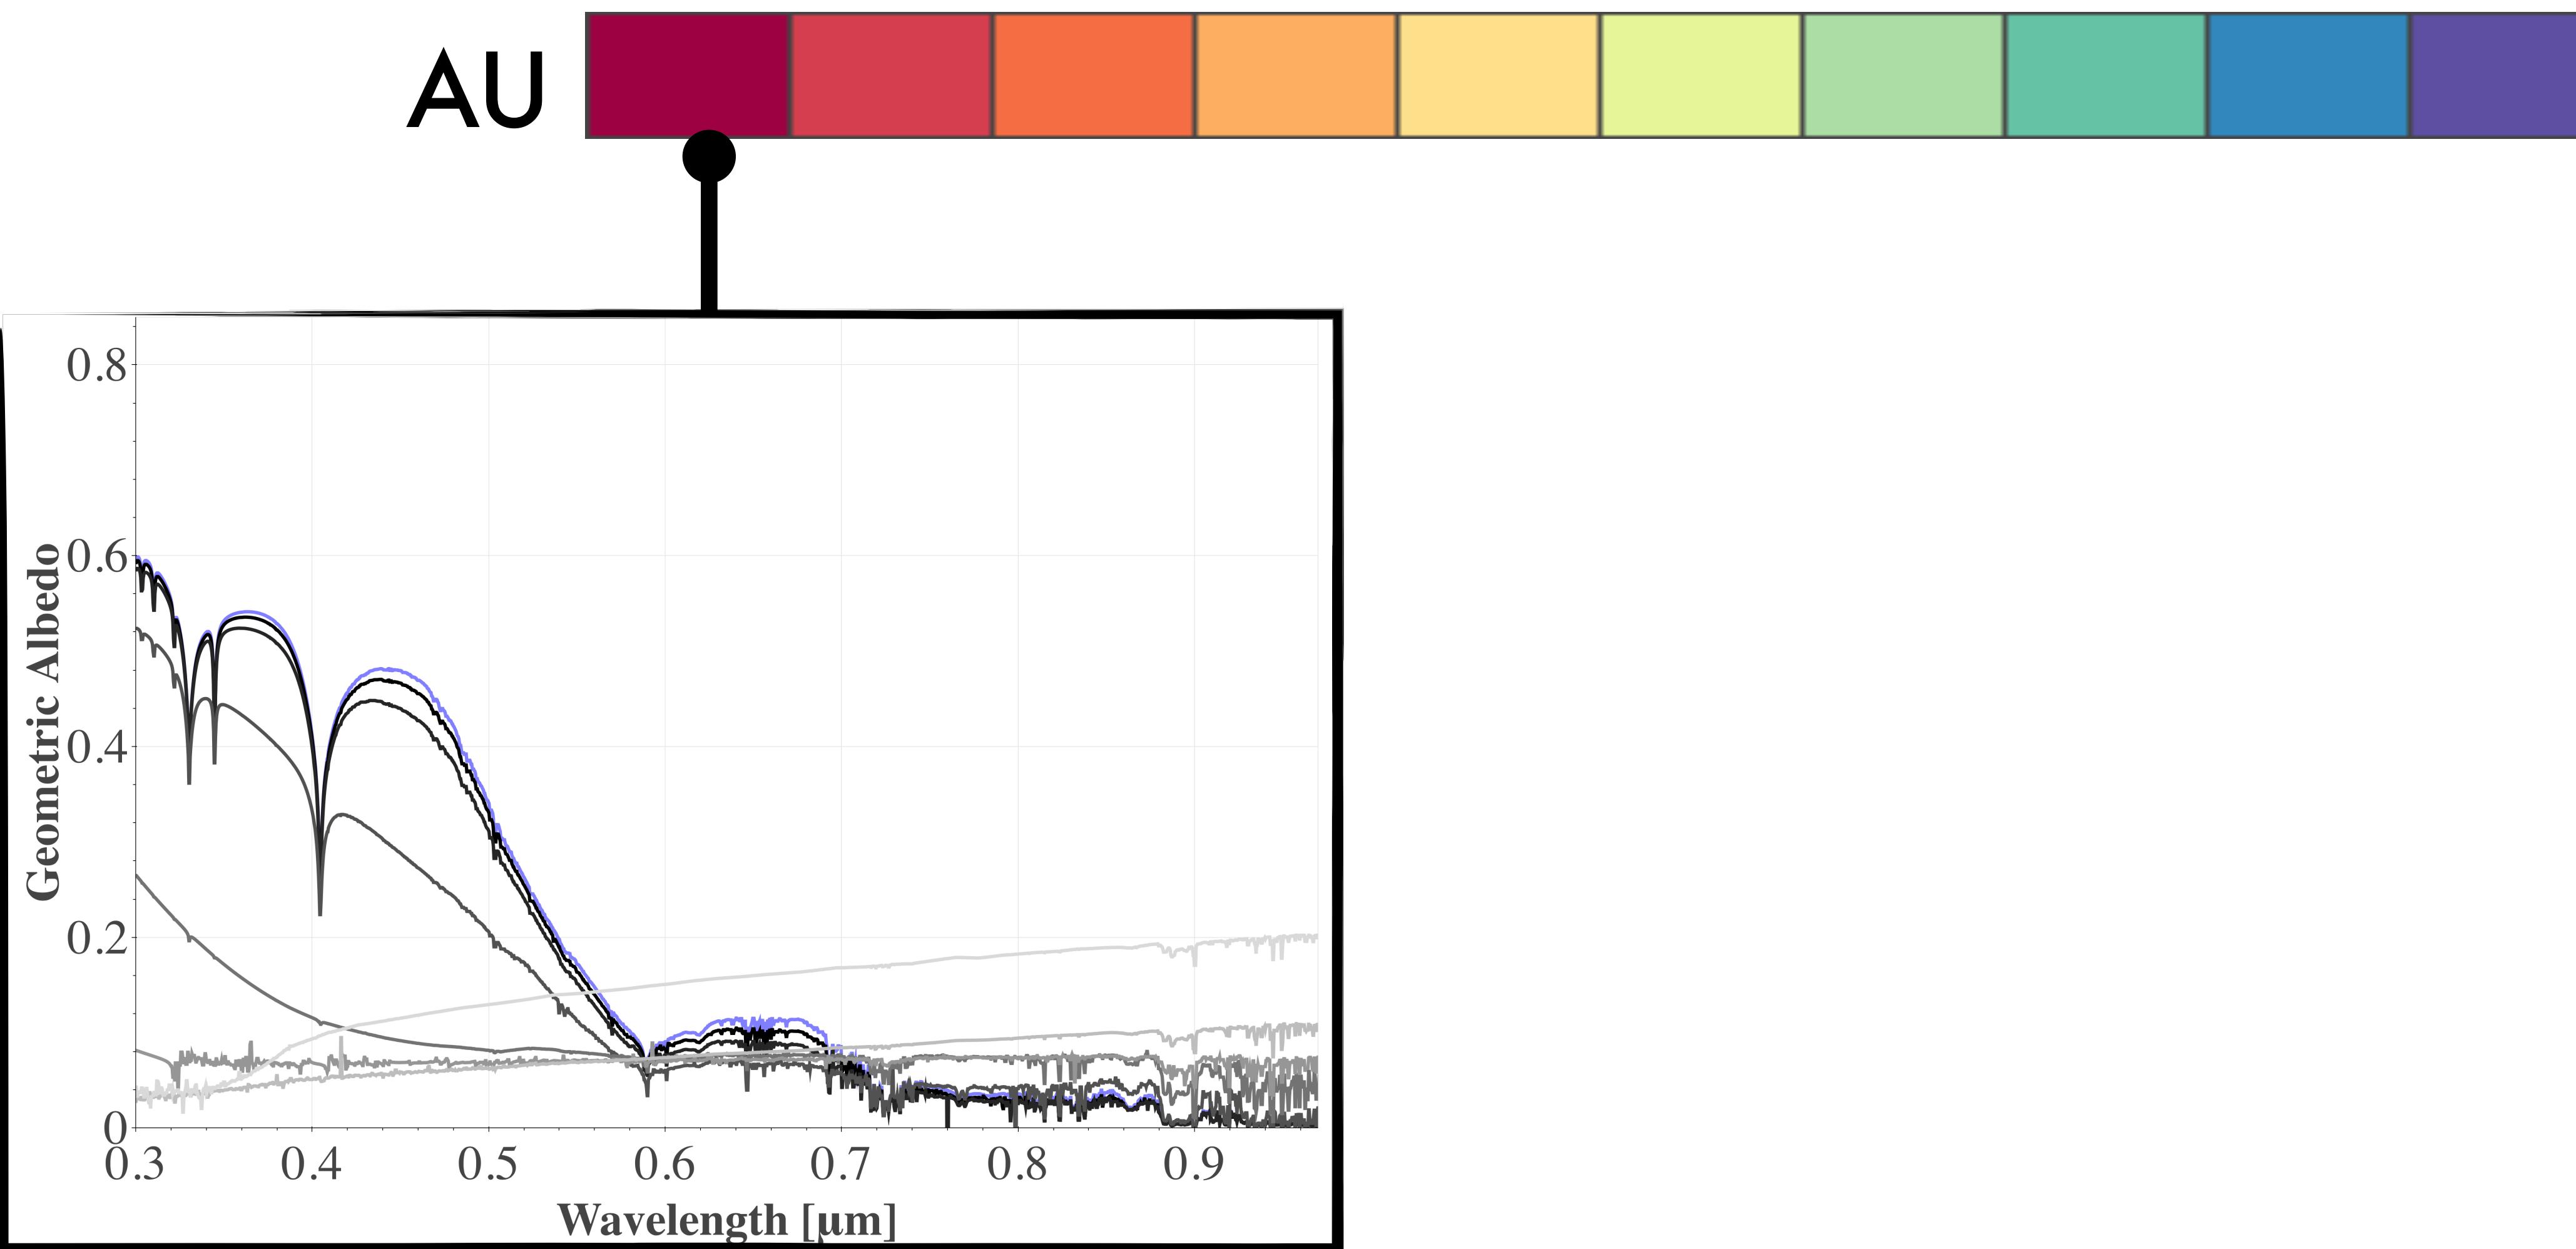

**Full Phase**

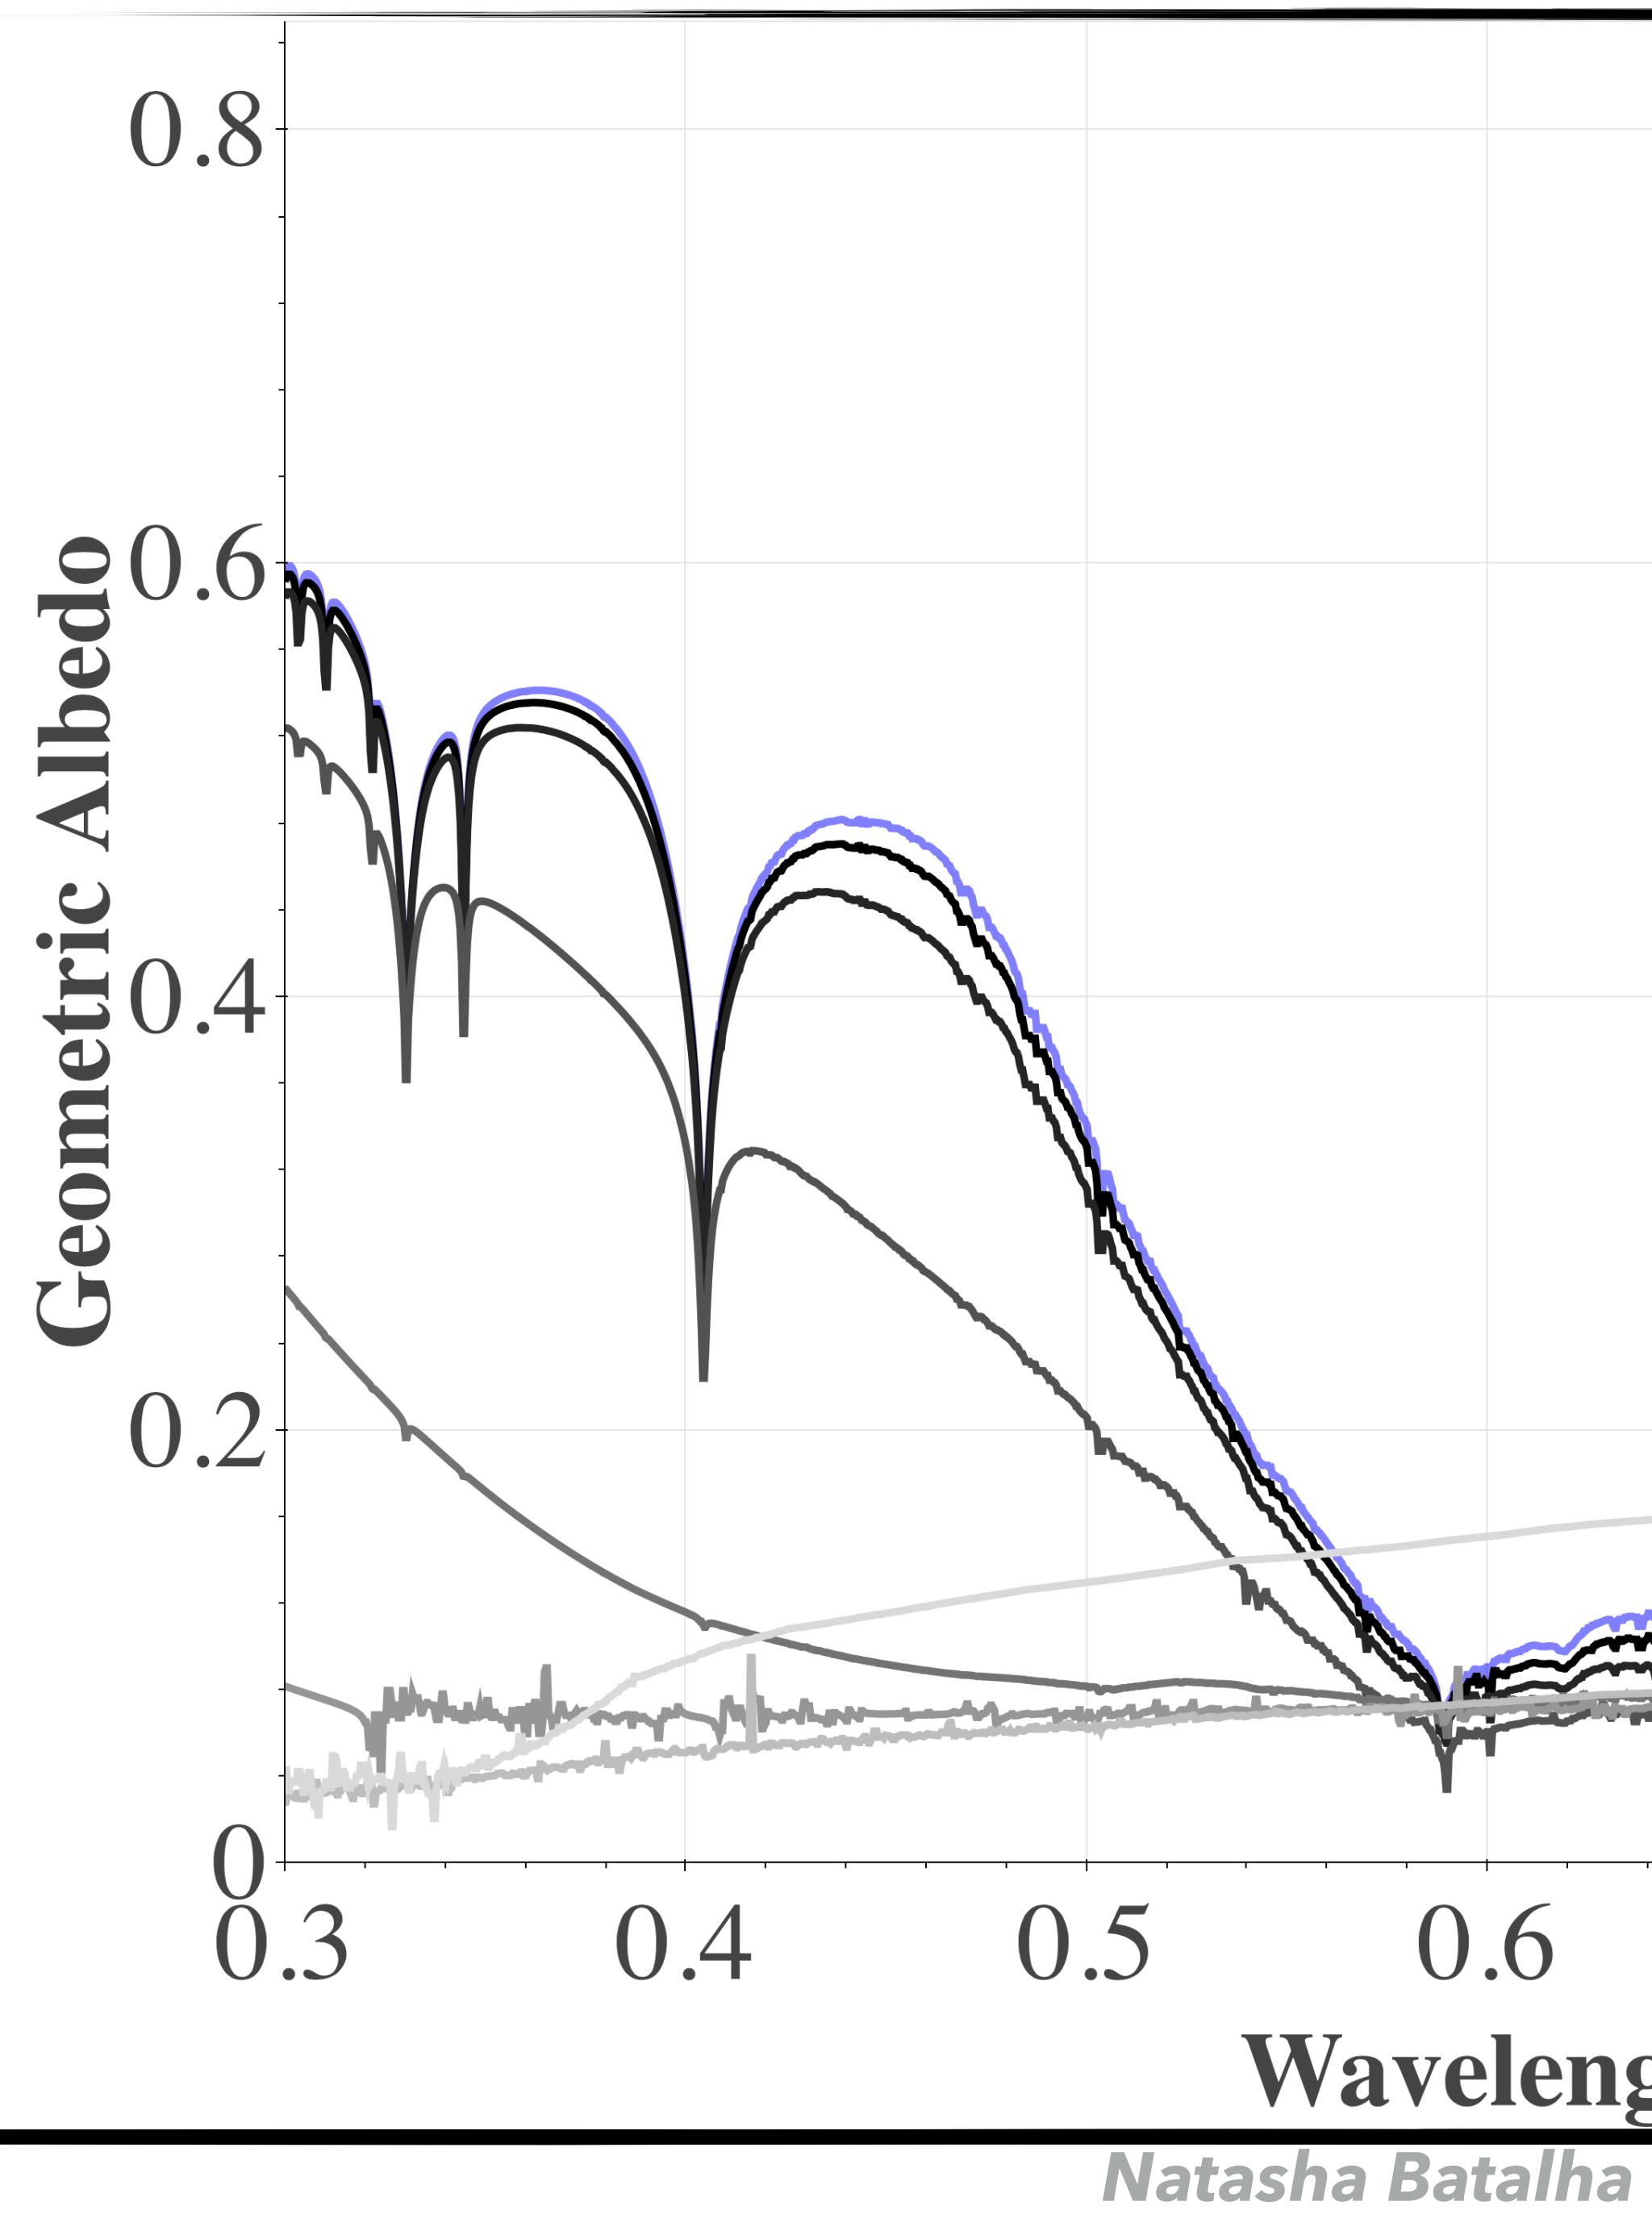

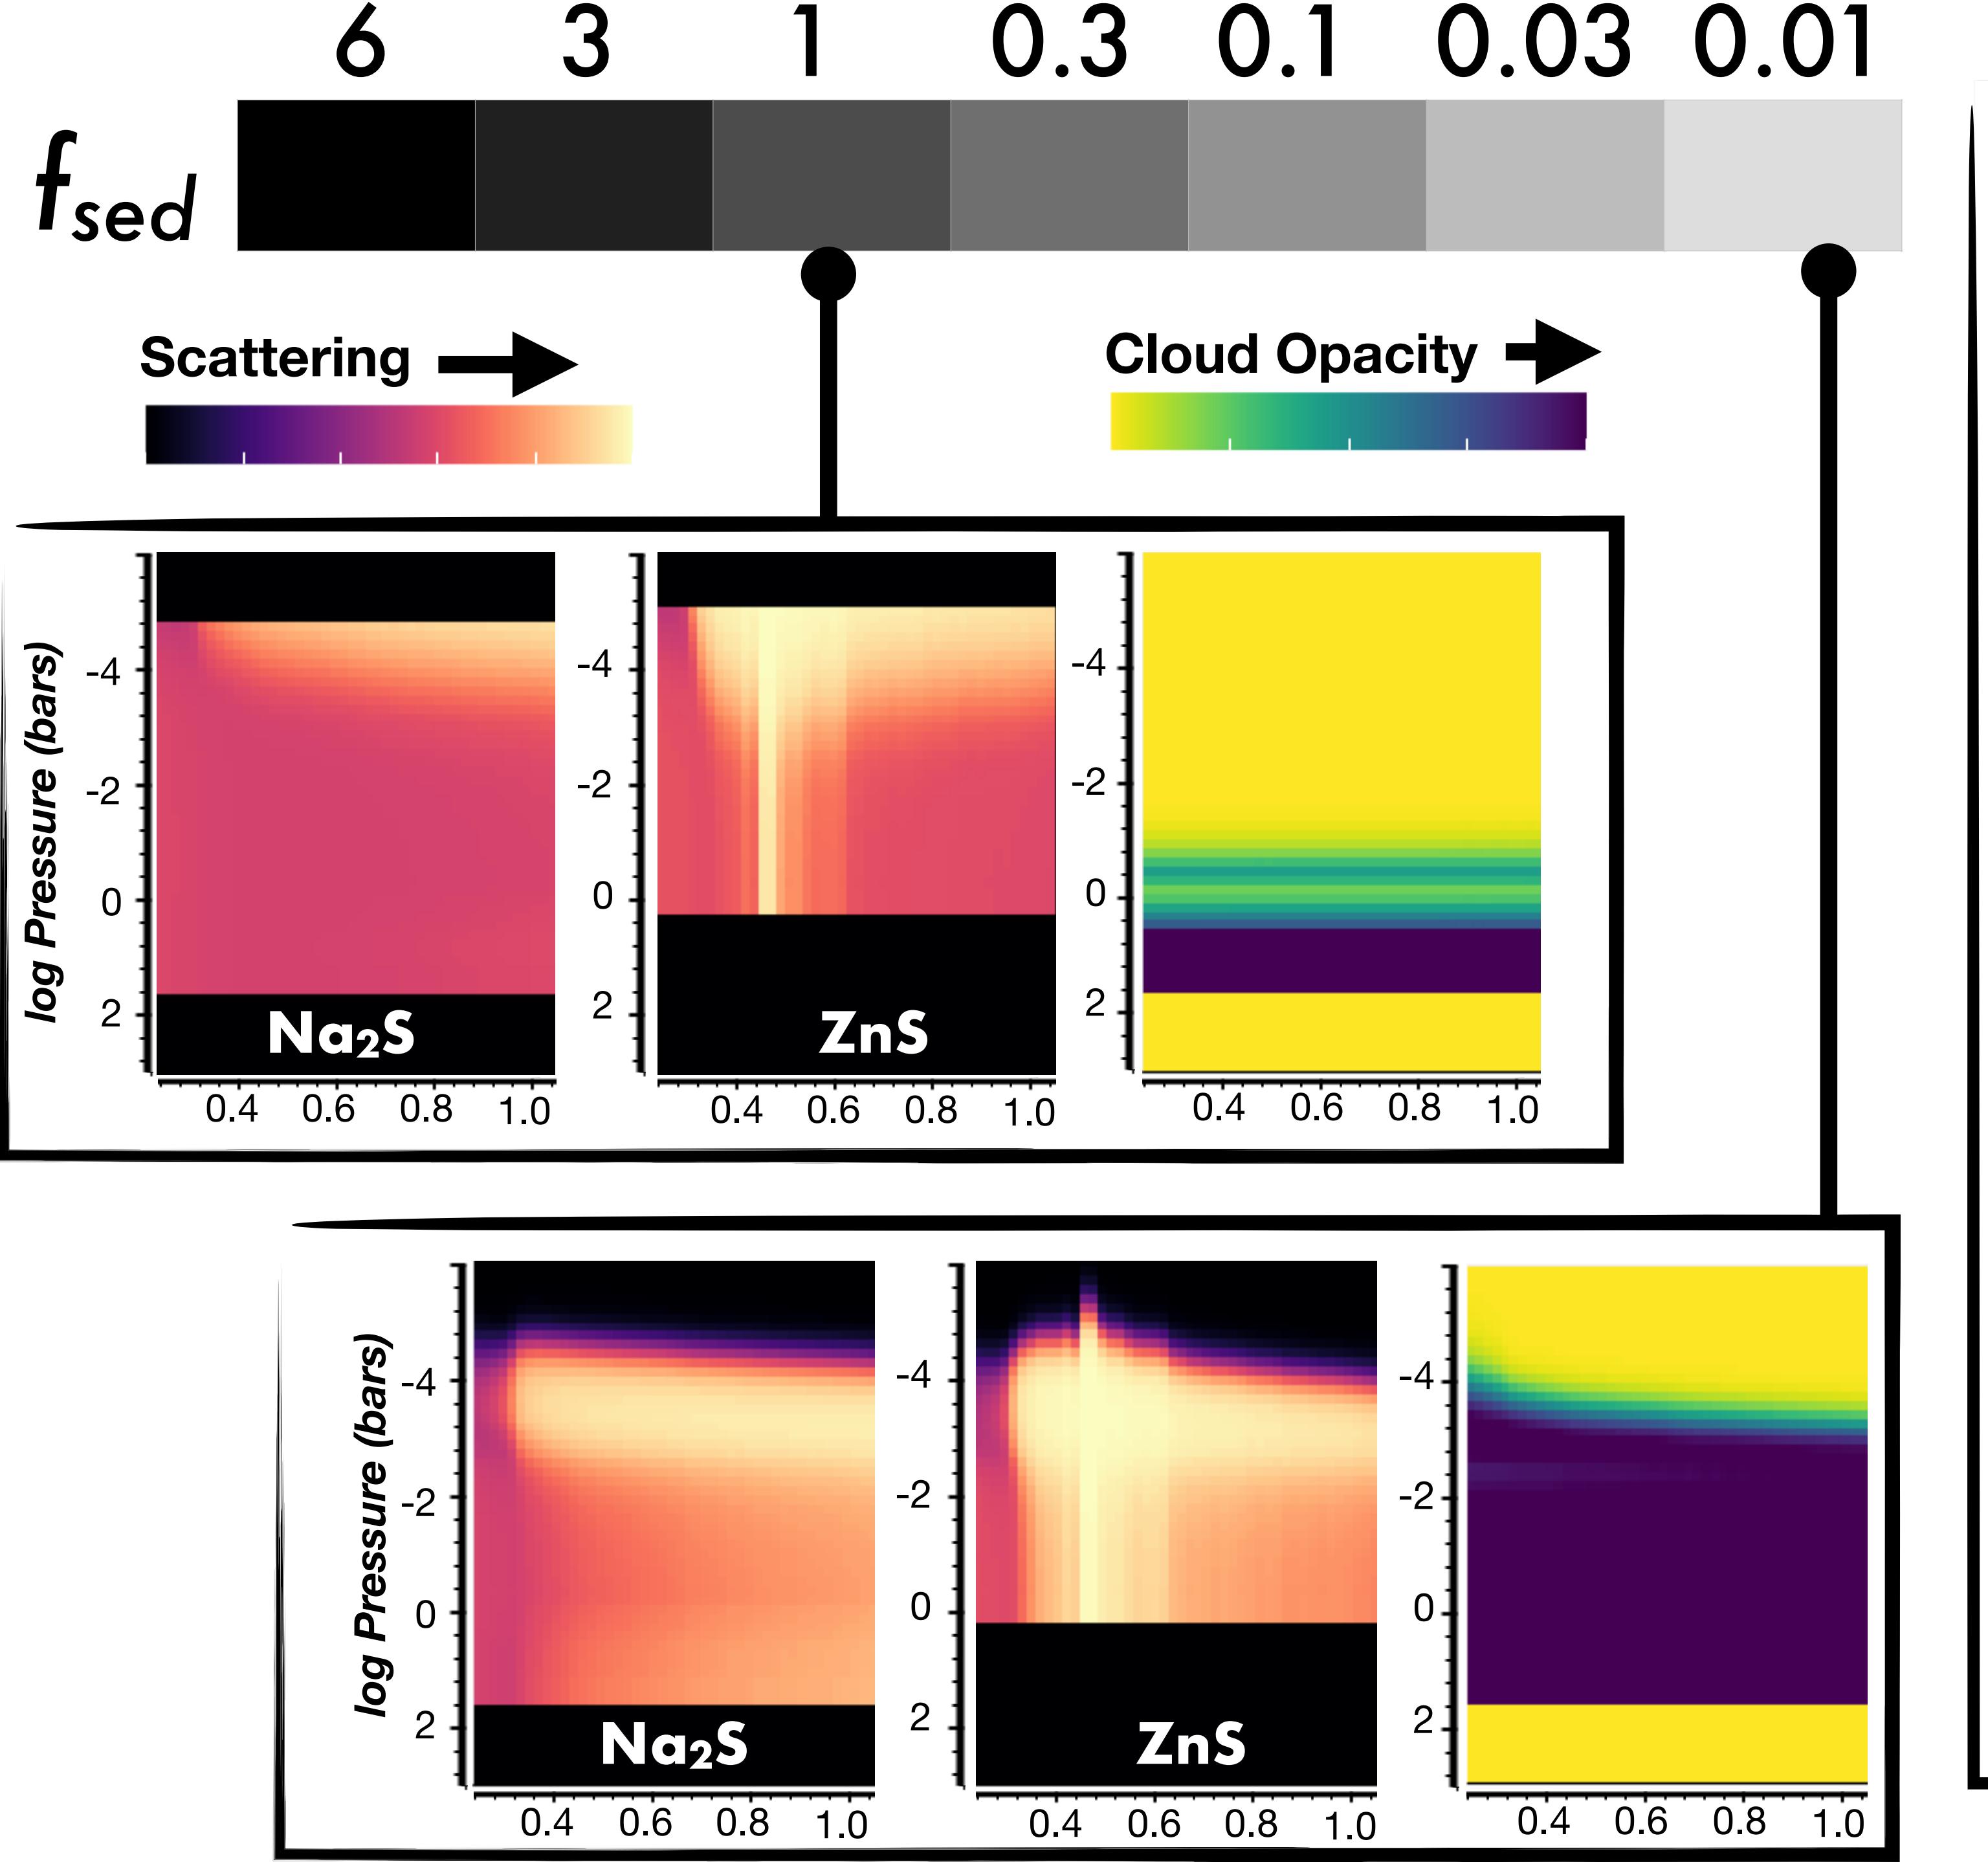

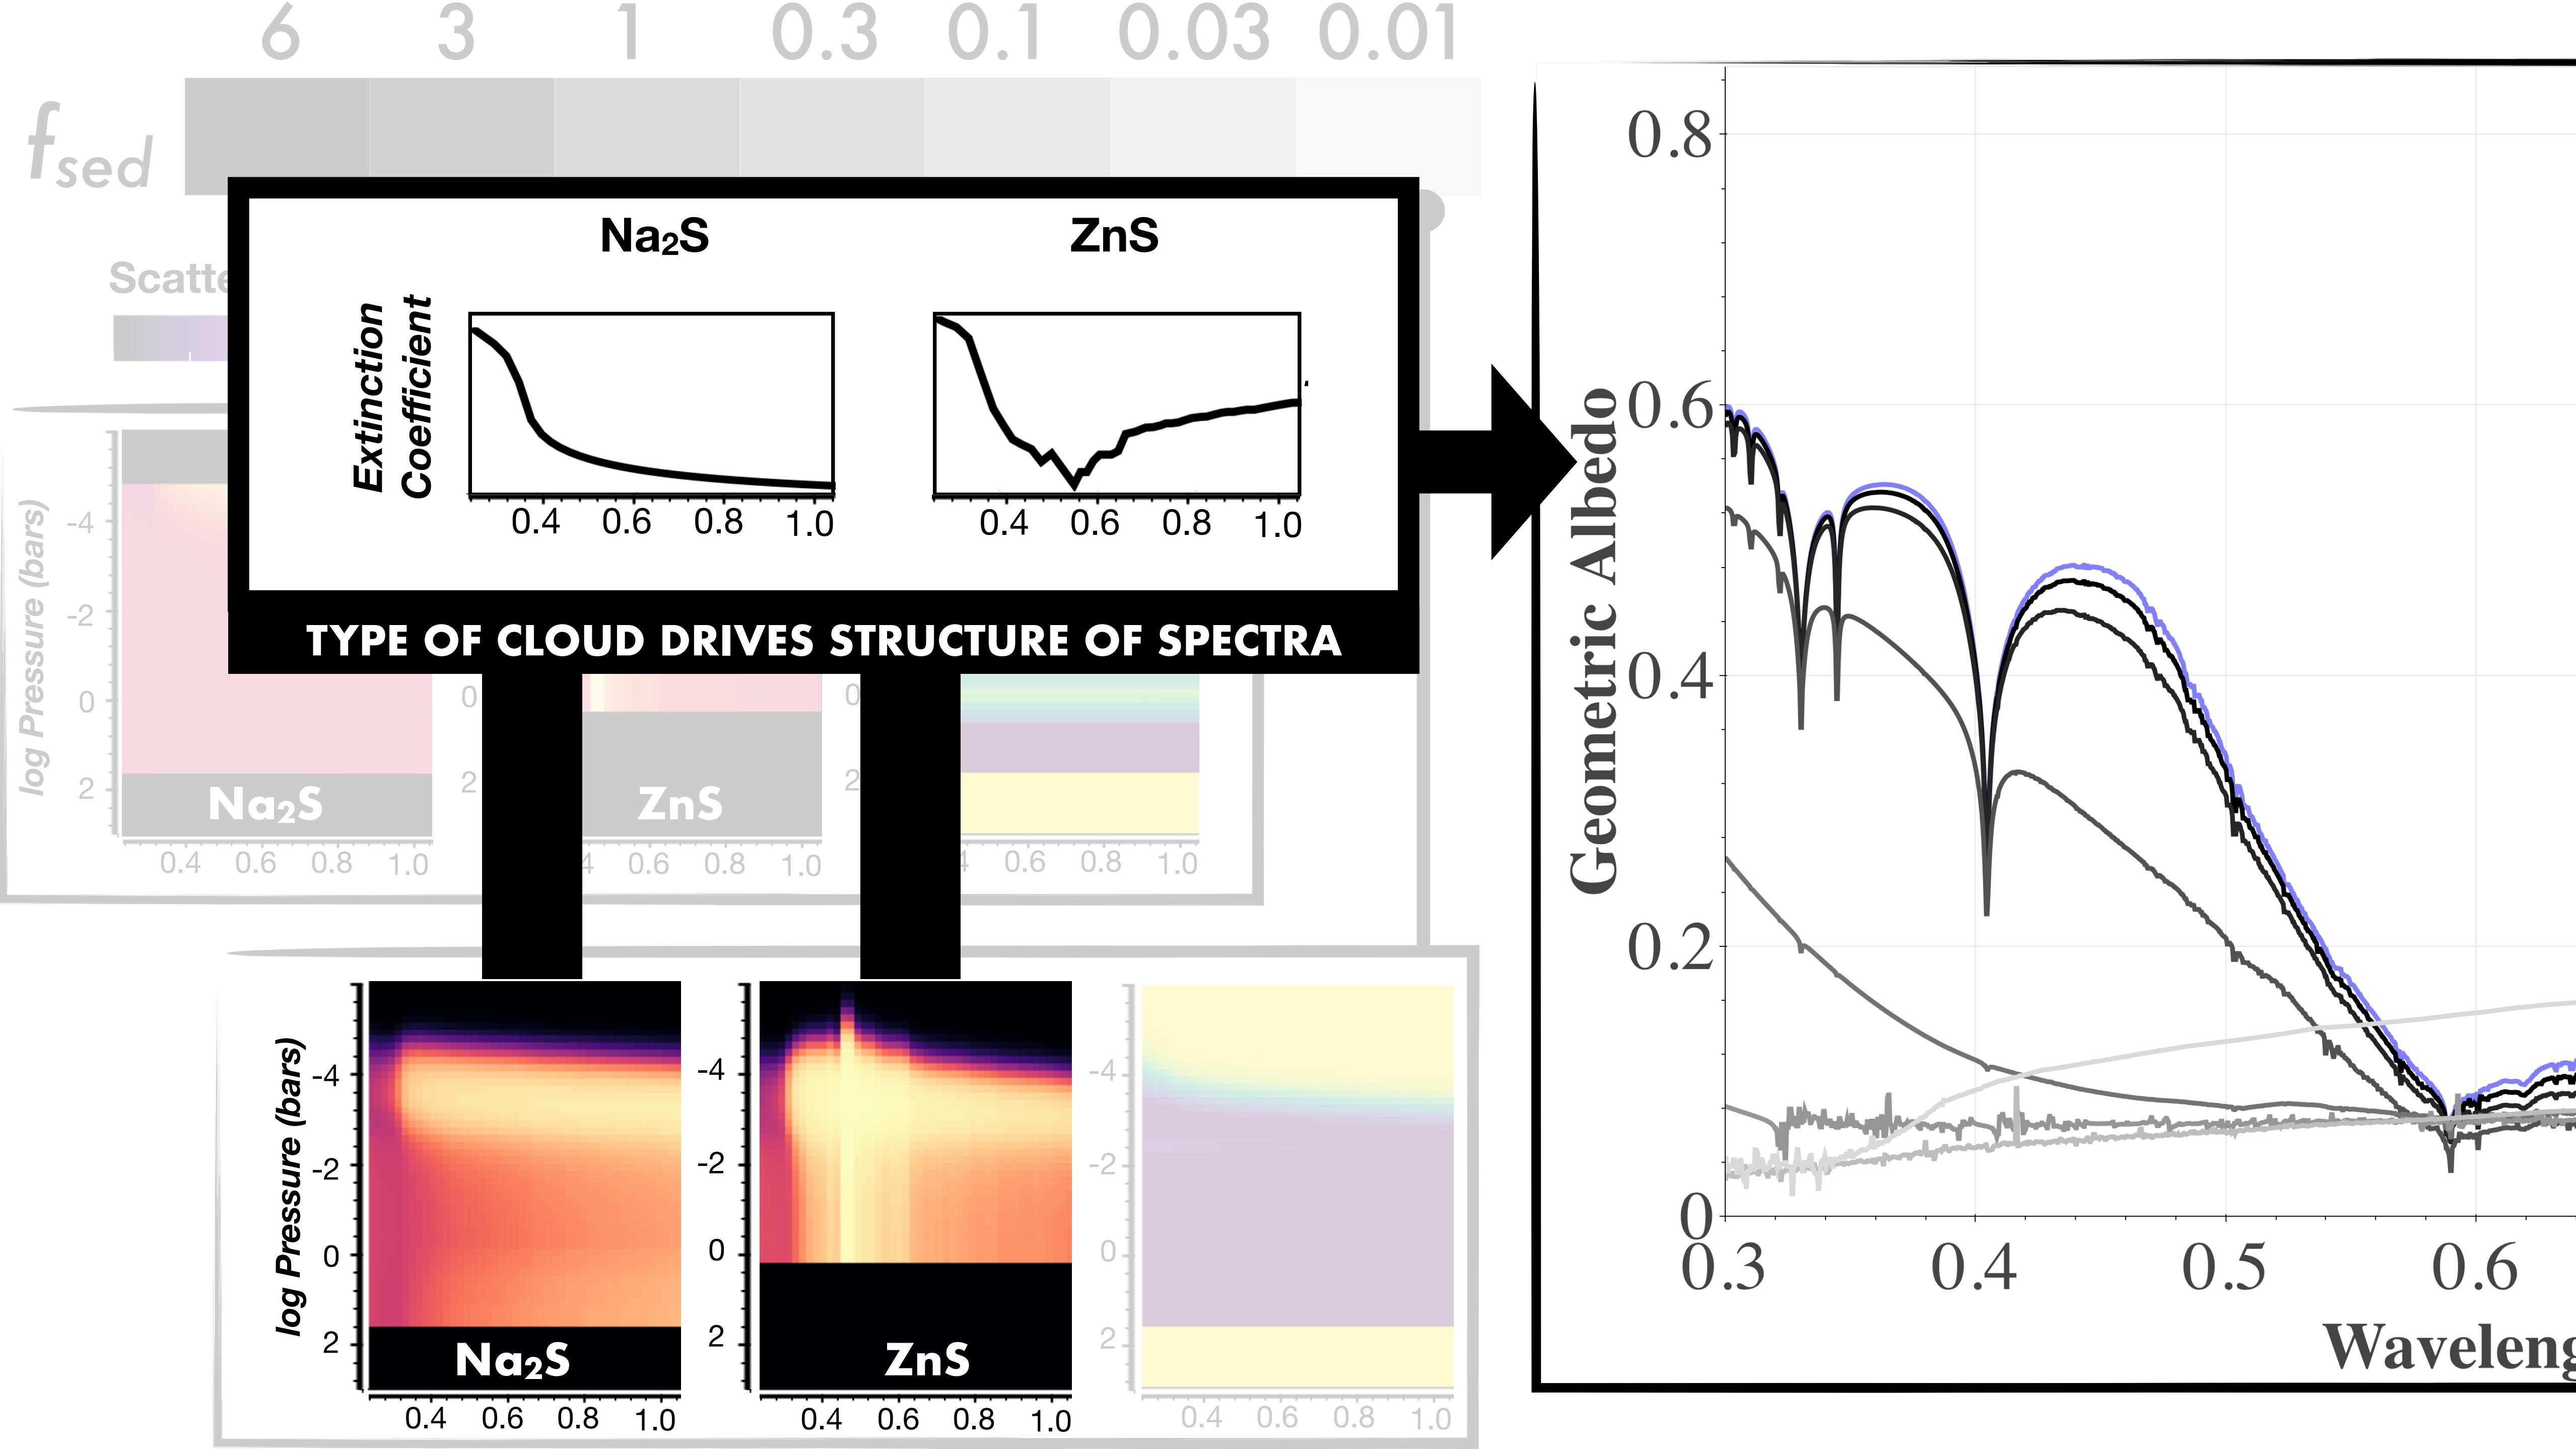

# Clouds drive structure of reflected light spectra

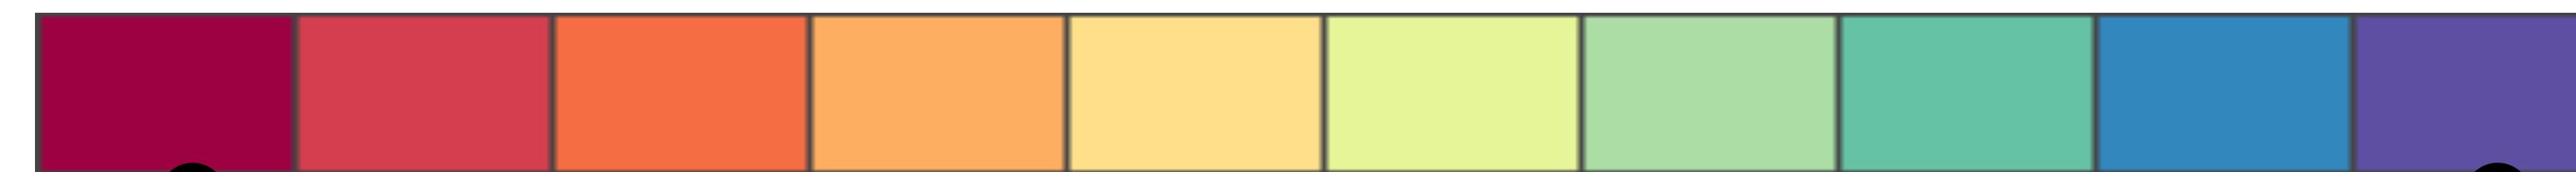

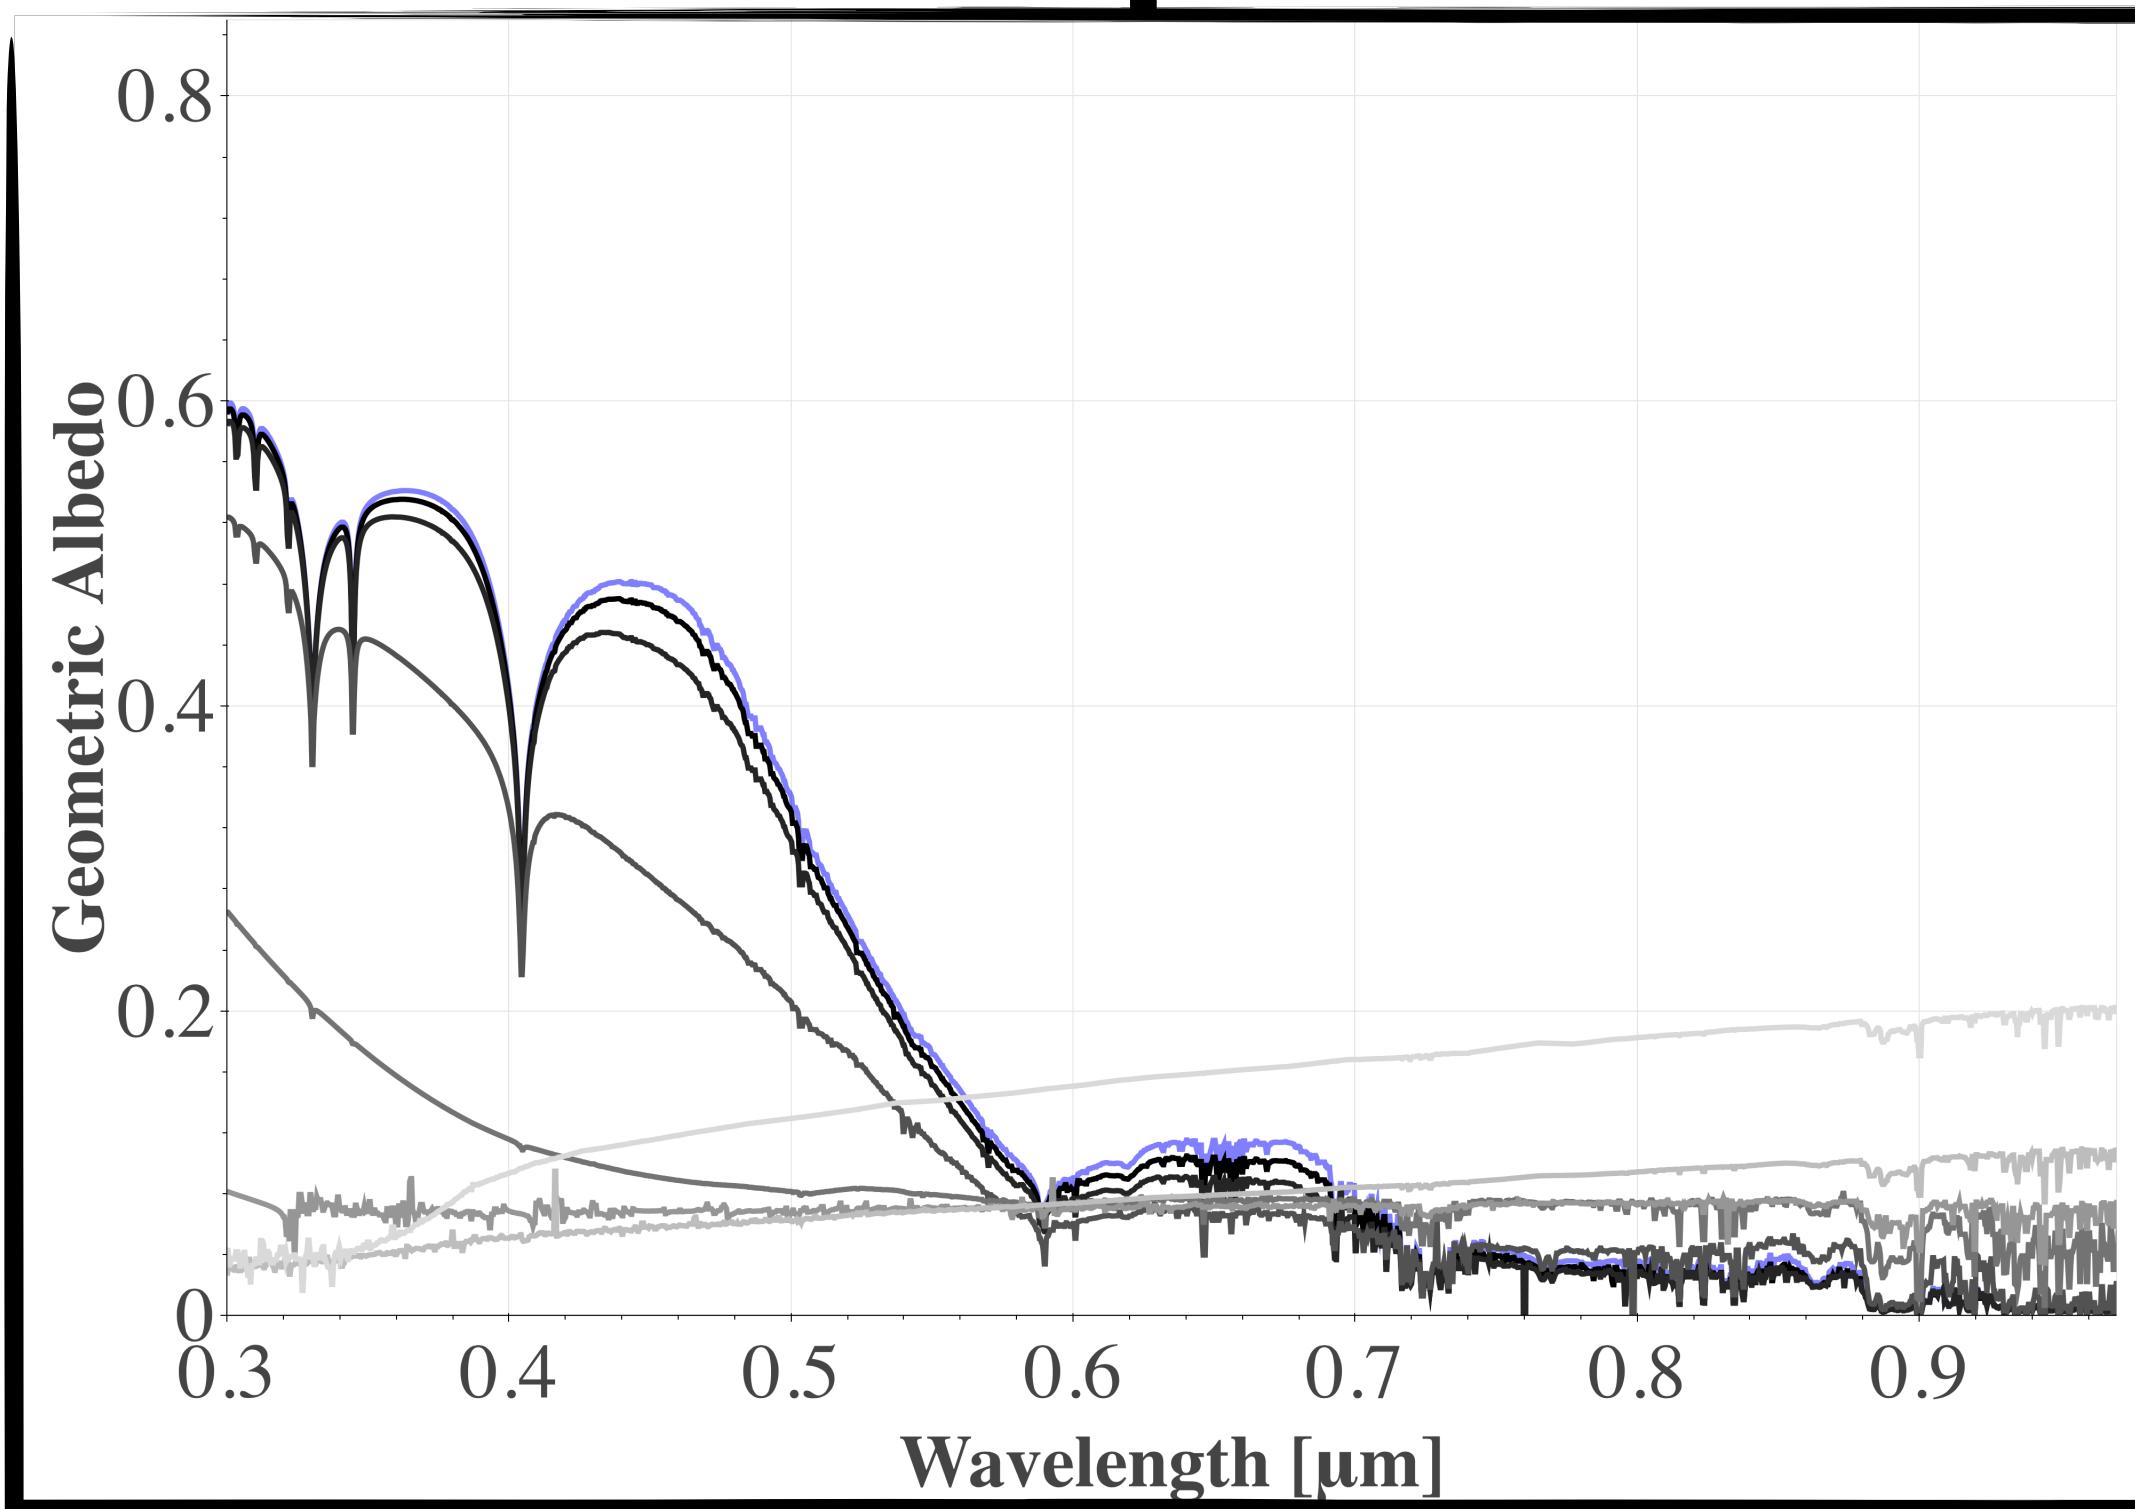

# Clouds drive structure of reflected light spectra

50xSolar

100xSolar

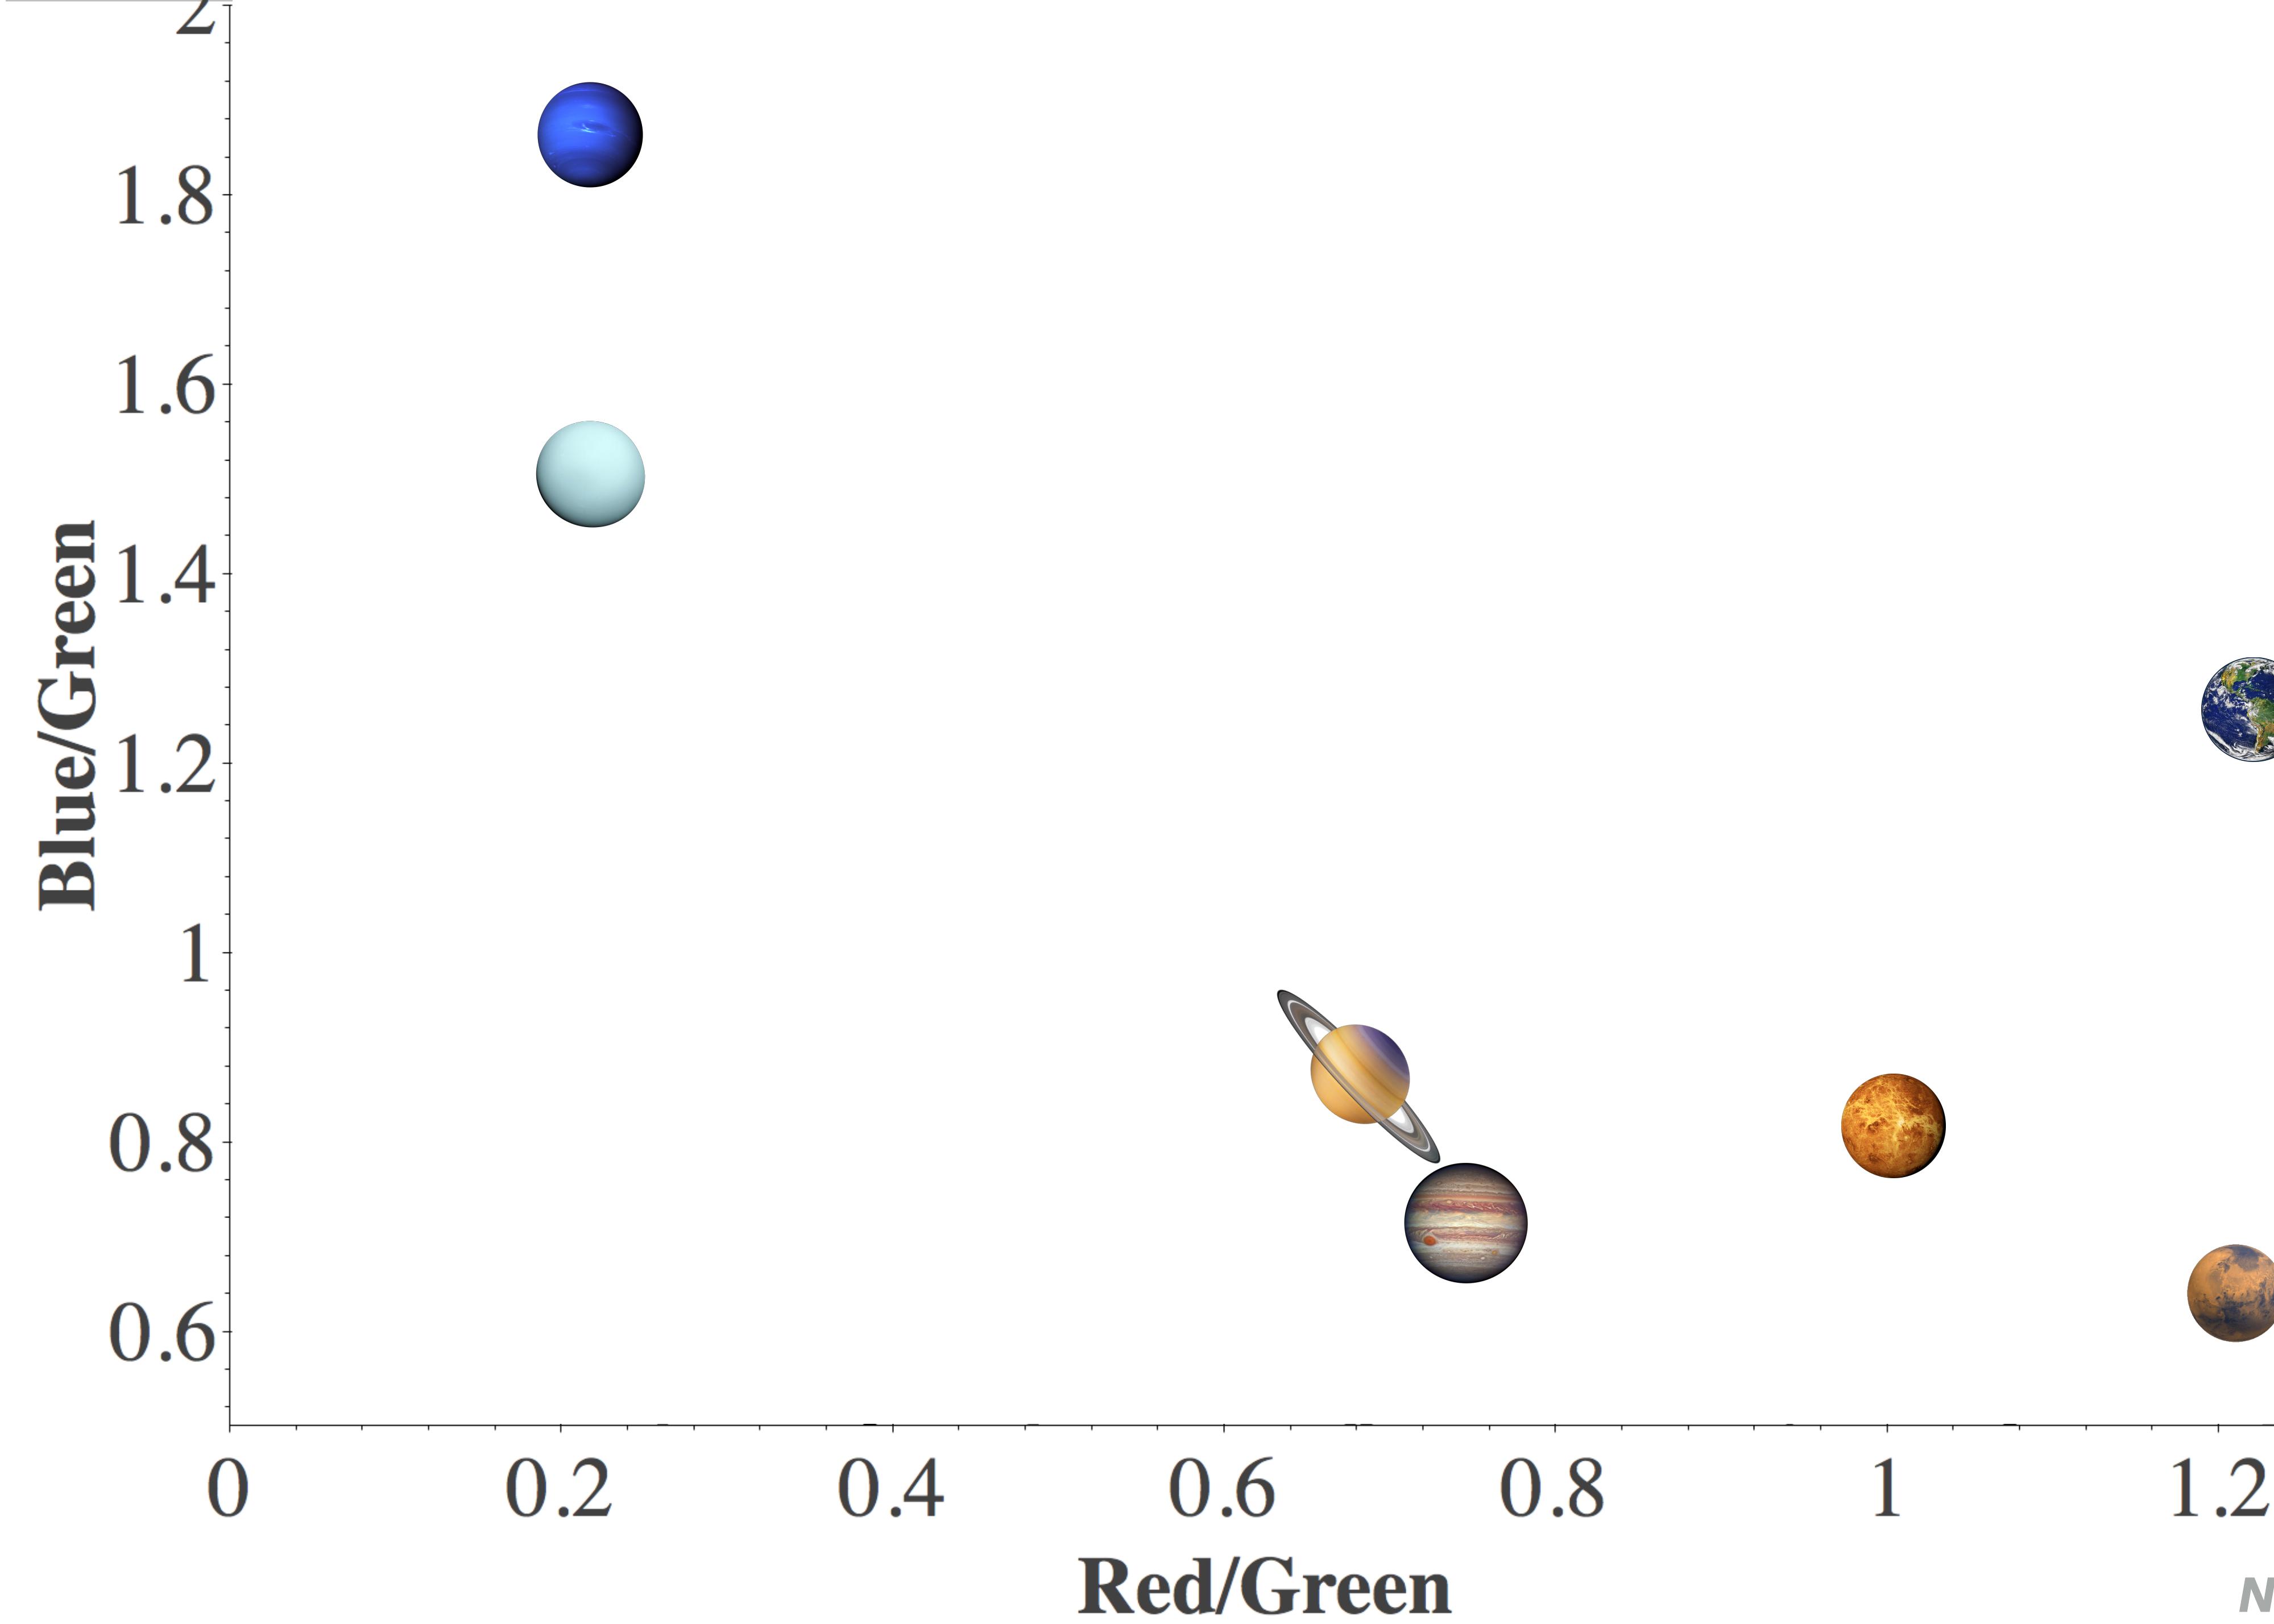

# Color Classification of Extrasolar Giant Planets

Not great for high fidelity atmospheric studies

3 carefully selected filters is great for identifying potential targets for more time intensive follow-up

# Goals:

---

- ▶ Are there any correlations between physical planet property and WFIRST-like filters
  - ✓ Yes, but clouds will largely drive photometry of directly imaged planets
- ▶ If so, can we leverage those to create meaningful color-color diagrams
  - ✓ Yes if it is known a-priori that the planet is clear
- ▶ If not color-color plot, can lots of statistics do the trick?
  - ✓ ML techniques help especially in teasing out very cloudy cases

# Goals:

---

- ▶ Are there any correlations between physical planet property and WFIRST-like filters

✓ Yes, but clouds will largely drive photometry of directly imaged planets

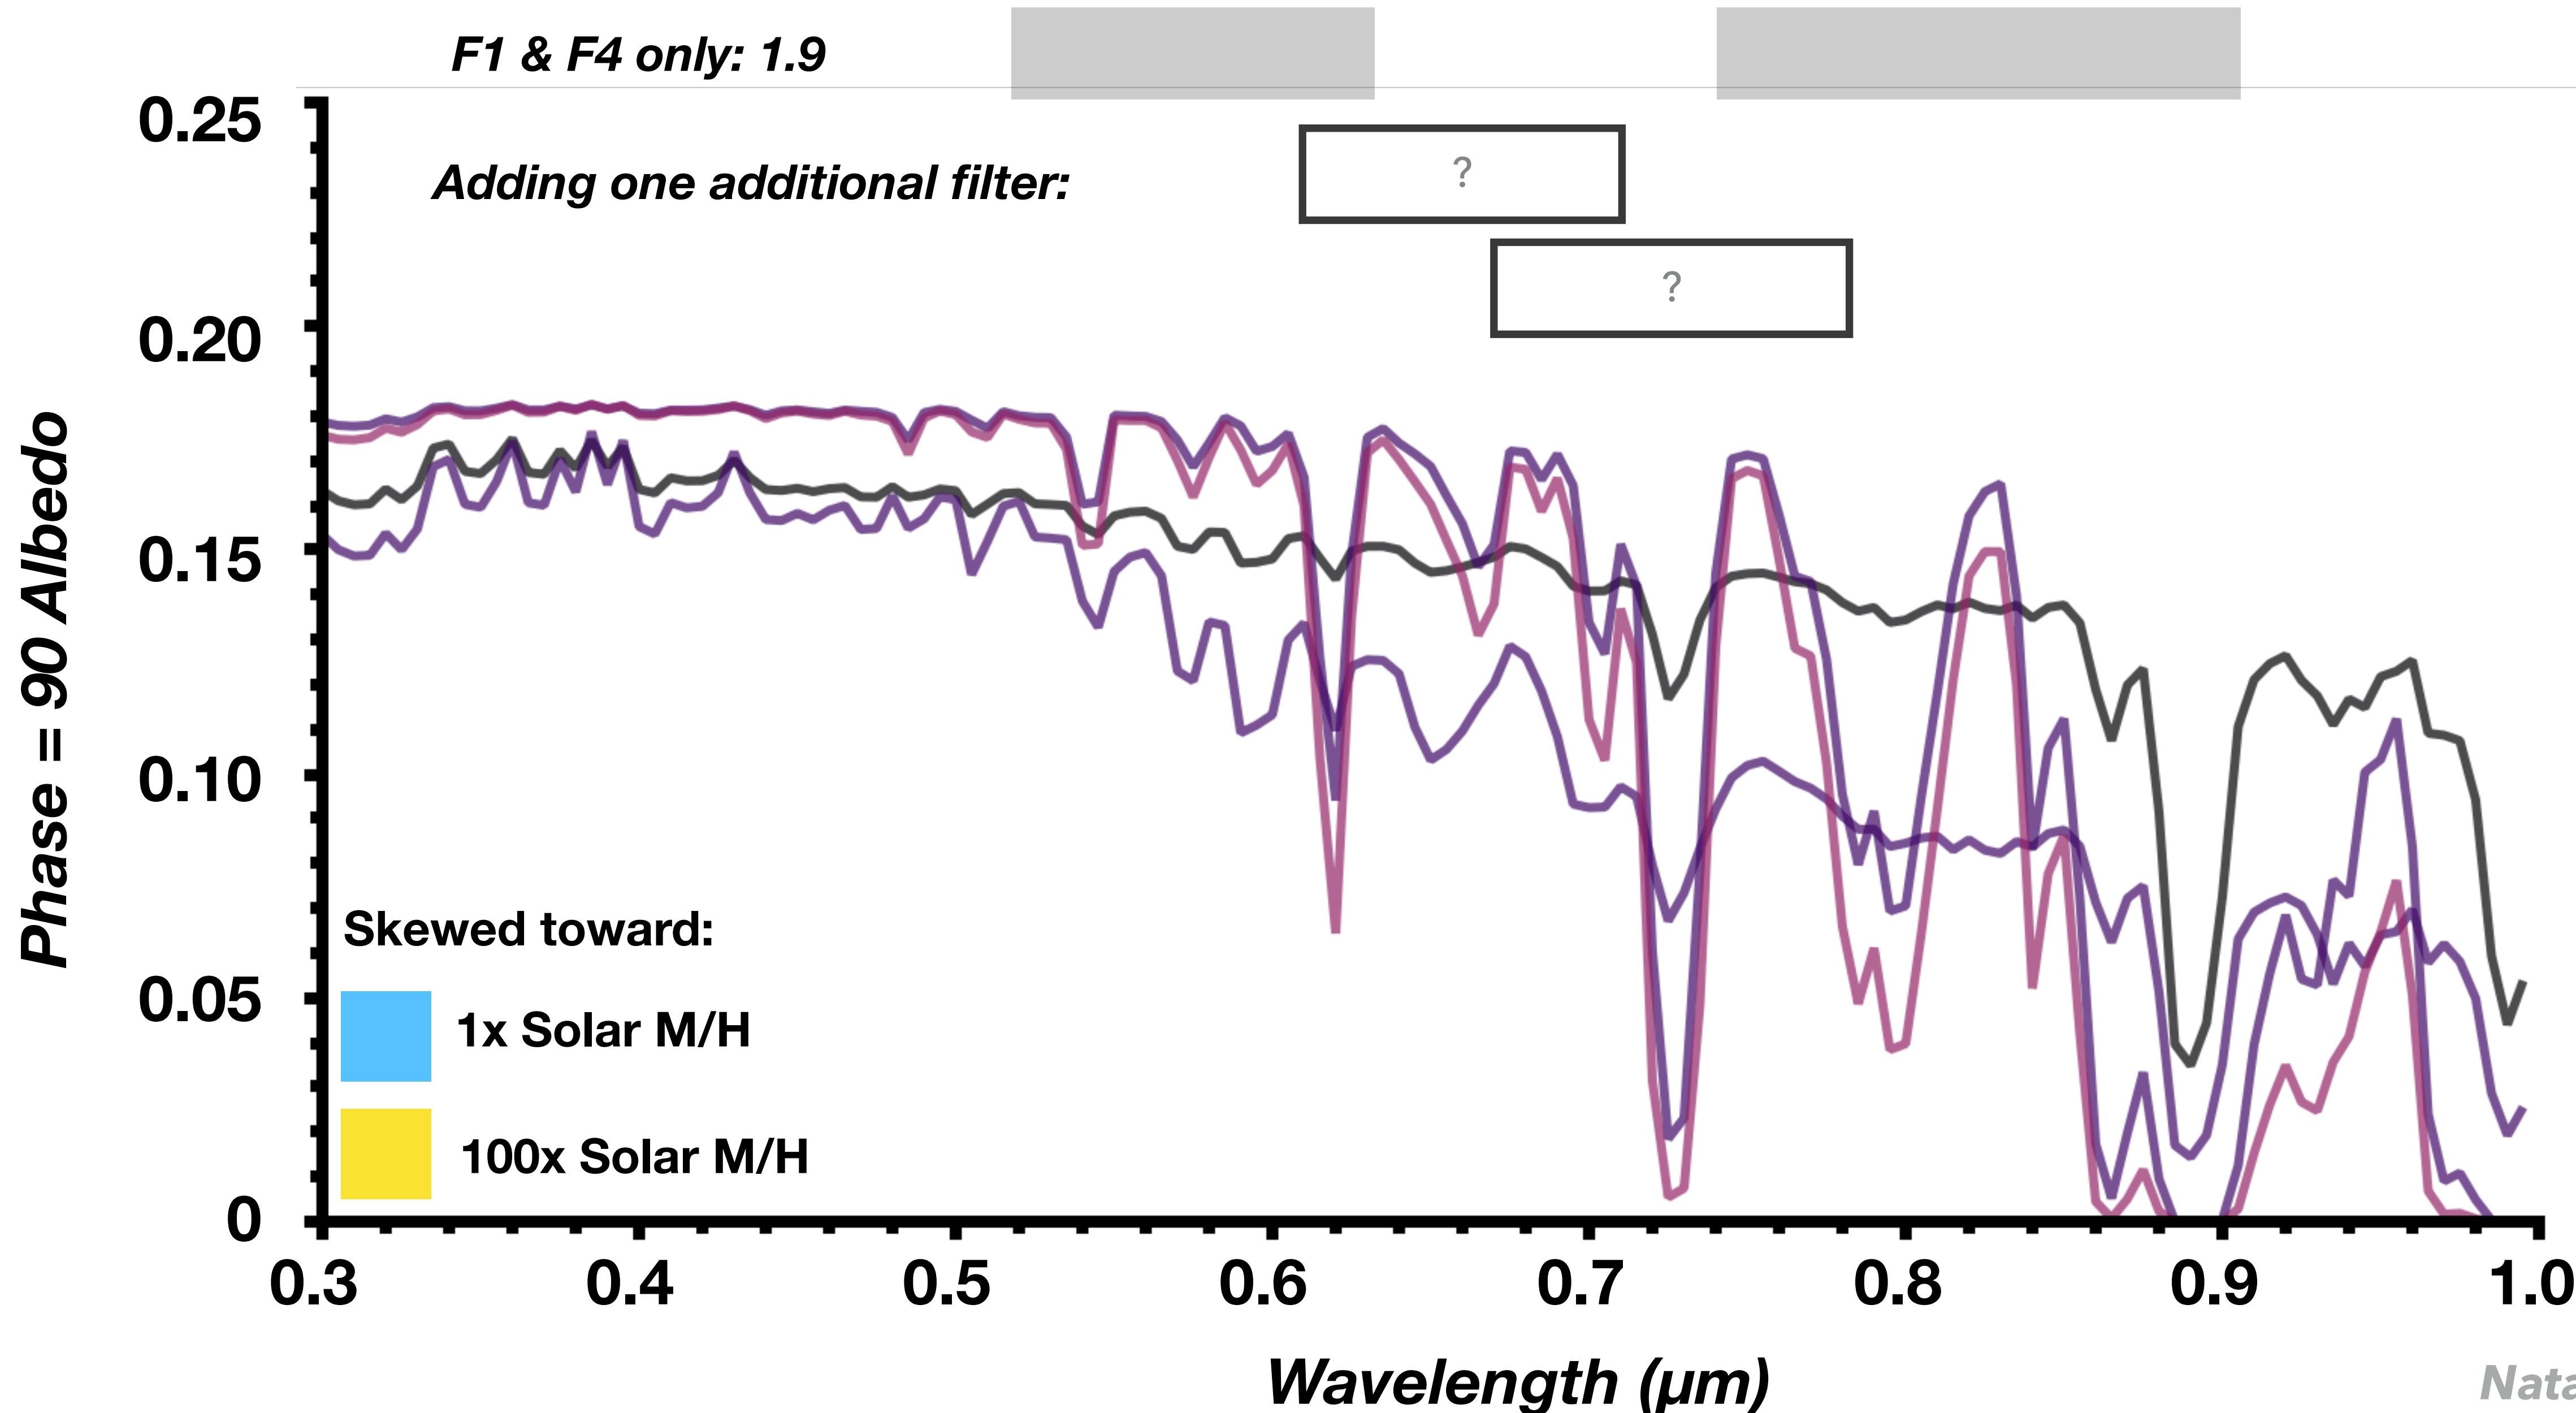

- ▶ If so, can we create new diagrams?

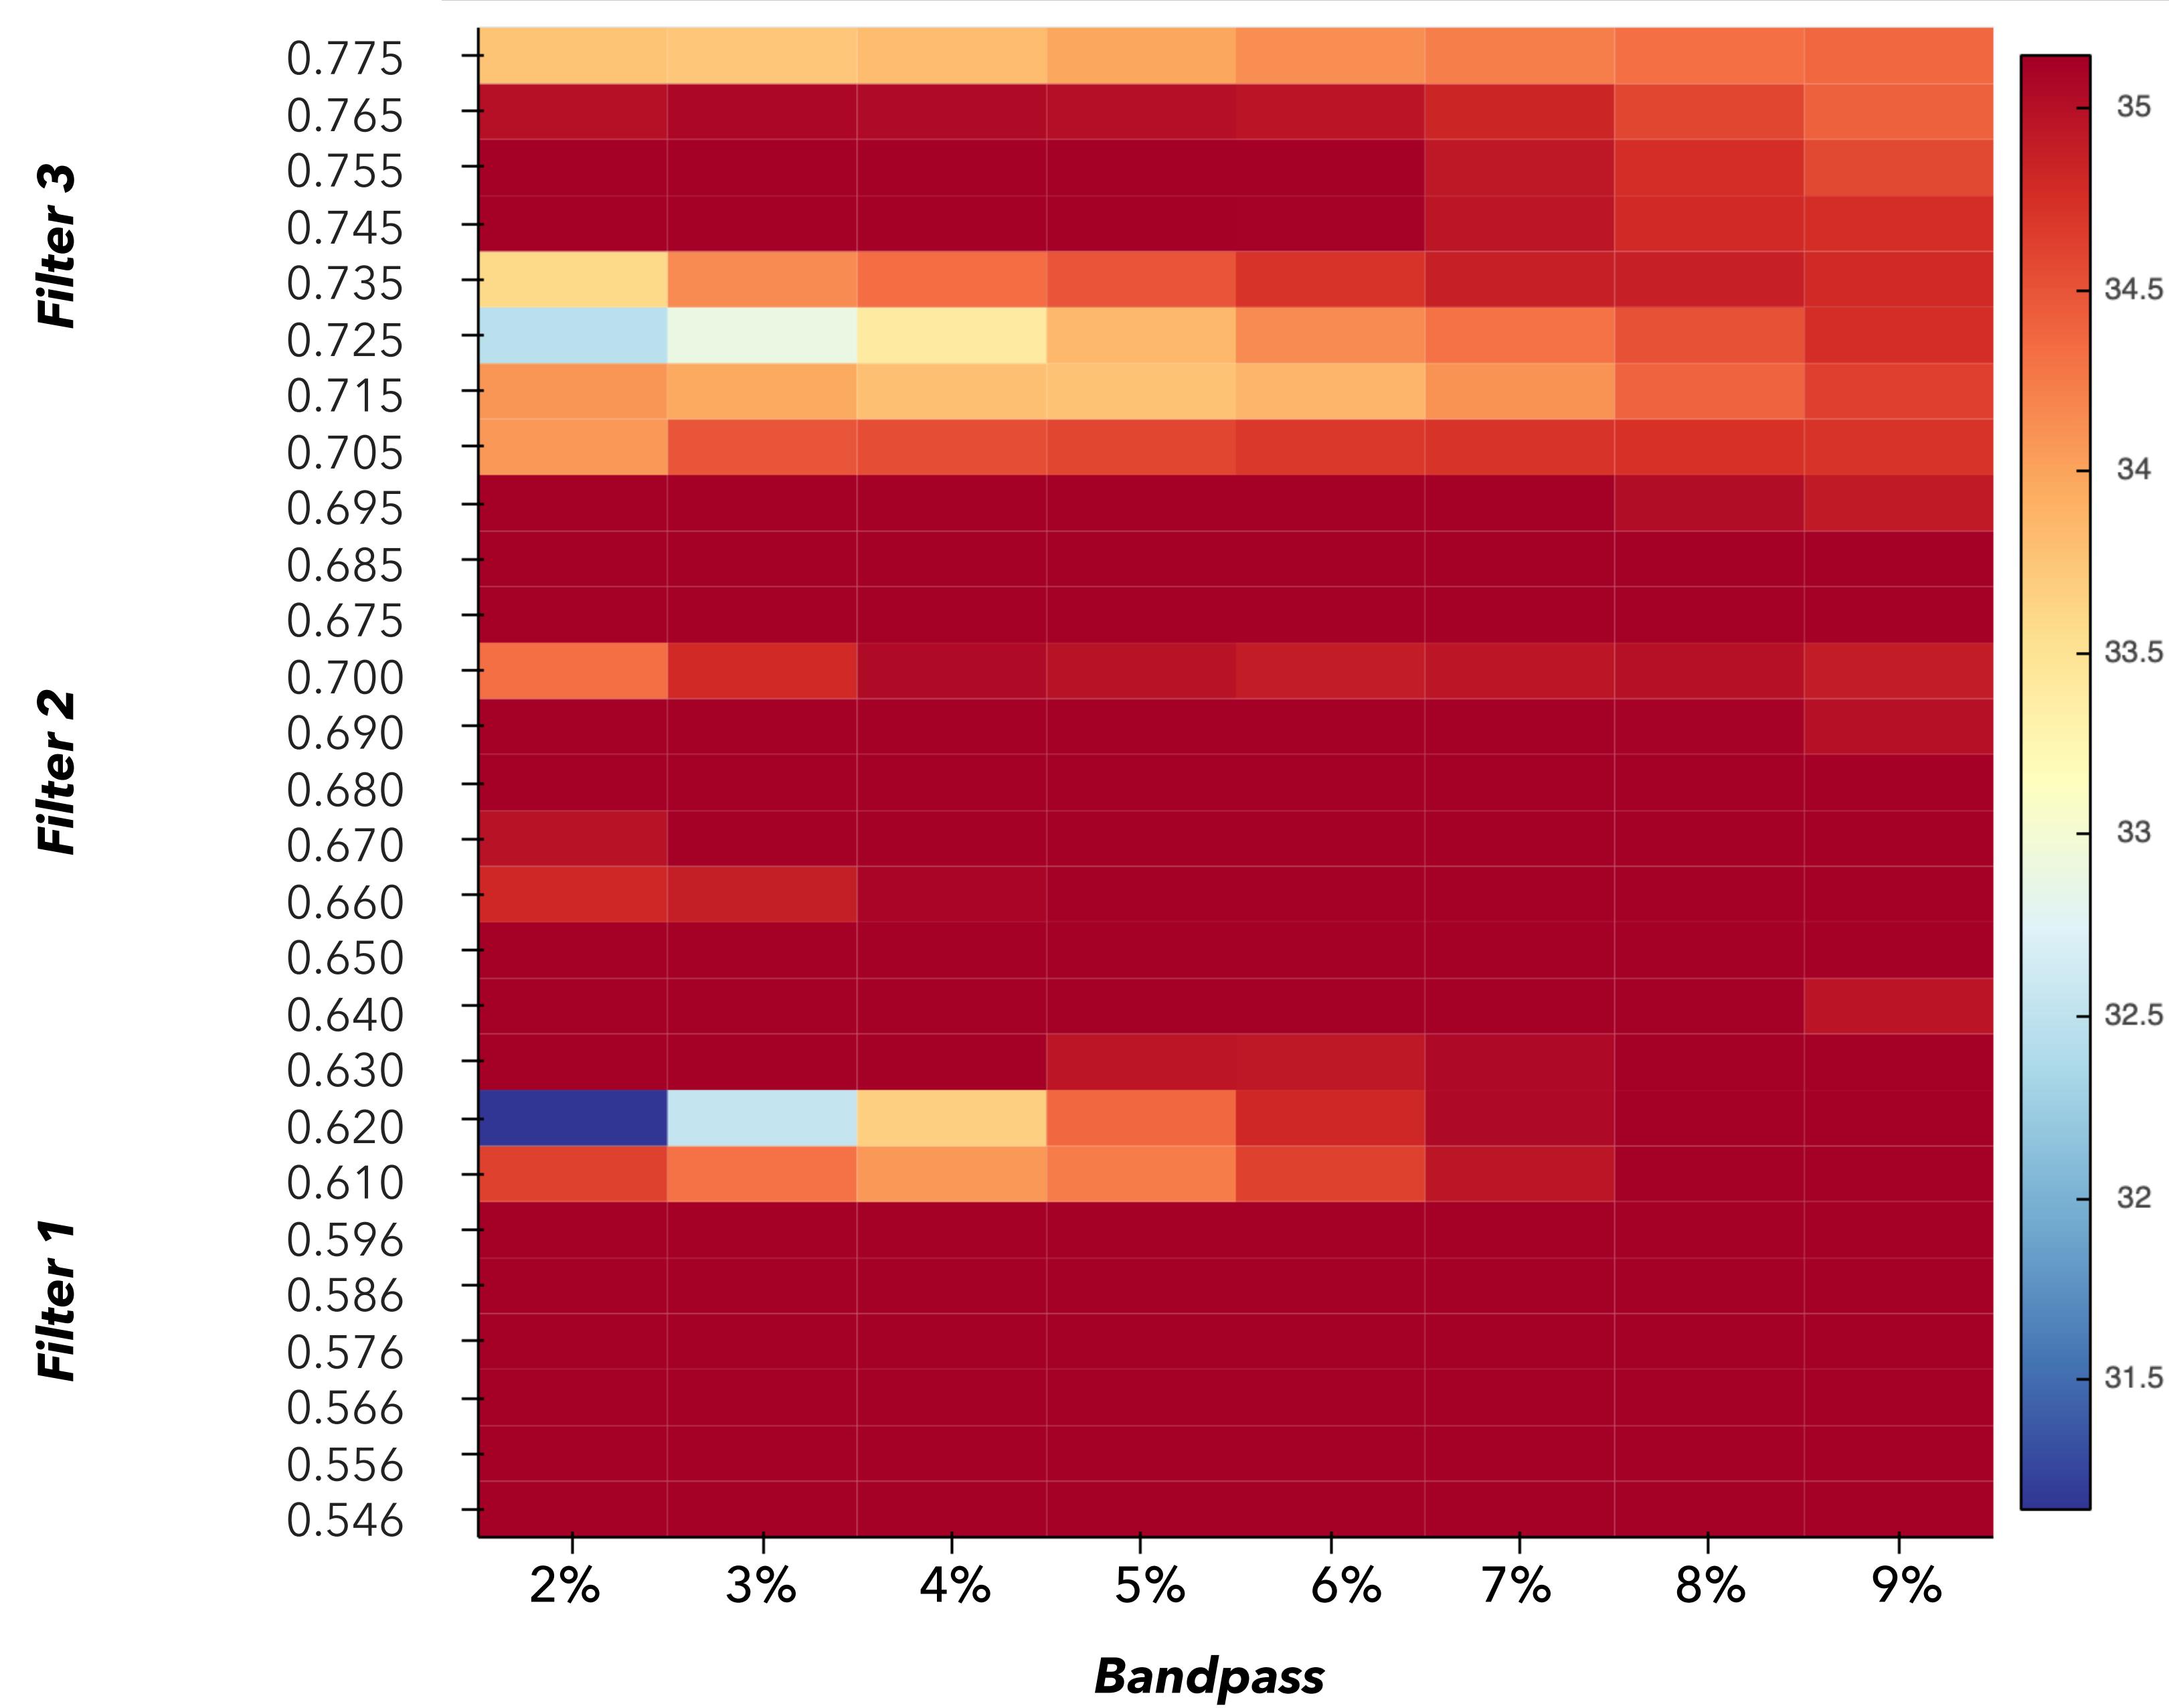

What about for current WFIRST??

- ▶ If not color-color plot, can lots of statistics do the trick?

✓ ML techniques help especially in teasing out very cloudy cases
